content\">\n <h2>Glossary</h2>\n <p><h4>Climate Metrics</h4></p>\n
<br>\n <p class=\"text-sm\">Sustainability data is as of the date identified in
the report sections above, usually on a month lag. All metrics are reported in
USD unless otherwise stated.</p>\n <br>\n <p class=\"text-
sm\"><strong>Portfolio Coverage</strong> is dependent upon the universe
covered by State Street Investment Management's external providers. For
certain markets and types of companies, there may be significant limitations in
the availability of data, or in some cases, no data may be available at all. In such
instances, the benchmark index provider, investment manager, an affiliate of
the investment manager or another party may use data from a related entity as
a proxy or generate estimated data to fill these gaps.</p>\n <p class=\"text-
sm\">Data treatments stated below apply but do not include item #2.</p>\n
<br>\n <p class=\"text-sm\"><strong style=\"text-
decoration:underline\">Green Revenue - MSCI:</strong> Weighted Average of
each Underlying Security with Green Revenue for the portfolio and benchmark
level. Data Treatments stated below apply.</p>\n <p class=\"text-
sm\"><strong style=\"text-decoration:underline\">Brown Revenue:</strong>
Percentage of revenue from \"brown\" sectors and activities, including fossil
fuel extractions, mining, operations, and power generation, employing MSCI
revenue indicators. Brown revenue (%) is defined as the proportion of revenues

```

a company derives from activities related to the extraction of fossil fuels, or power generation using fossil fuel-based energy sources. It reflects firms tied to conventional energy value chains.

- Brown Revenue Portfolio - MSCI:** Weighted Average of each Underlying Security with Brown Revenue for the Portfolio. Data Treatments stated below apply.
- Brown Revenue Benchmark - MSCI:** Weighted Average of each Underlying Security with Brown Revenue for the Benchmark. Data Treatments stated below apply.

Potential Emissions - MSCI: Sum of Weighted Average Total Potential Emission of Fossil Fuel Reserves Normalized by EVIC \$MN (ktCO₂-eq per \$MN invested) on Portfolio and Benchmark Level. Data Treatments stated below apply.

Green Bonds: The Climate Bonds Initiative (CBI) defines green bonds as debt instruments that finance projects with environmental benefits, and the CBI Green Bond Database uses a methodology to evaluate and categorize projects as green. The CBI's methodology includes the following criteria:

- Self-labeling:** The issuer must consciously label the instrument as a green bond.
- Public disclosure:** The issuer must provide sufficient information to determine if the financed assets are green. This includes information such as the amount outstanding and closing confirmation.
- Eligible sectors:** The financed assets must be in eligible sectors, such as energy efficient products and processes, or non-energy GHG reductions.
- Eligible use of proceeds:** The proceeds must be used for eligible purposes.

Green Bonds Portfolio - CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Data Treatments stated below apply but do not include item #2.

Green Bonds Benchmark - CBI: Market Value of Securities with Green Bond as a Percentage of the Total Market Value of all Securities in the Benchmark. Data Treatments stated below apply but do not include item #2.

Green/Fossil Fuel Based Revenue Ratio - MSCI: The Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio level and the Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio and Benchmark level. Data Treatments stated below apply, additional missing data treatment to replace nulls with zero.

Companies with SBTi Approved Targets - MSCI: The percentage of the fund's market value

exposed to issuers that have carbon emissions reduction targets approved by the Science Based Targets initiative (SBTi) on both the Portfolio and Benchmark level. Data Treatments stated below apply but do not include item #2.

Low Carbon Transition Score - MSCI: Score calculates a company's climate transition risk by aggregating Scope 1, 2 and 3 emissions, emissions avoided, and the quality of the company's climate management into a score between 0 (highest risk) and 10 (lowest risk). Companies with higher Low Carbon Transition score are more aligned with the Low Carbon Transition compared to the companies with lower scores. Score calculated at both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Risk Rating- ISS: Assesses a company's ability to deal with climate change and the transition to a low-carbon economy rated on a scale of 0 to 100, with 0 being very poor and 100 being excellent. The Carbon Risk Rating provides an aggregated score indicating a company's overall climate-related risk, using the company-specific risk exposure as baseline (Carbon Risk Classification) from which a company can take steps toward better alignment with a low carbon economy (Carbon Performance score).

Weighted Average of each Underlying Security with a Carbon Risk Rating Value for both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Footprint(t CO2e/\$M EVIC):

- Scope 1+2+3- MSCI: Weighted average of Scope 1, Scope 2 and Scope 3 carbon emissions intensity normalized by enterprise value including cash. Data Treatments stated below apply.
- Scope 1+2 - Data Treatments stated below apply.
- Scope 1 - Data Treatments stated below apply.
- Scope 2 - Data Treatments stated below apply.
- Scope 3 - Data Treatments stated below apply.

Total Carbon Emissions - MSCI: Total Carbon Emissions measures the absolute tons of CO2e EVIC for which an investor is responsible. It is apportioned to the investor based on an equity ownership perspective, and can be explained with a simple example: If an investor's position in a company is equal to 1% of the company's total market capitalization, then the investor owns 1% of the company, and is consequently responsible for 1% of the company's carbon emissions (tons CO2e). Calculating the "owned" emissions from each position in the portfolio and summing those emissions yields the total carbon emissions for the portfolio and benchmark level.

- Scope 1 emissions are "direct emissions" from sources that are owned or controlled by the company.

Data Treatments stated below apply.

- Scope 2** emissions are the indirect emissions released into the atmosphere from the use of purchased energy such as electricity, heat or steam. These are called "indirect emissions" because the actual emissions are generated at another facility such as a power station. Data Treatments stated below apply.
- Scope 3** emissions include all other indirect emissions that occur across the value chain and are outside of the organization's direct control. Data Treatments stated below apply.
- Scope 1+2** - Data Treatments stated below apply.

Total Carbon Emissions is not used to compare portfolios and benchmarks because the data is not normalized. Benchmark data will not appear in this section.

Sovereign- Total Carbon Emissions – MSCI: Total carbon emissions includes all greenhouse gas emissions produced within a country's borders from all sources, including energy production, industry, agriculture, and transportation apportioned by PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollar).

Scope 1 (excluding LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO₂ equivalent per year (tCO₂e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (including LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO₂ equivalent per year (tCO₂e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country territory (if available), in tons of CO₂ equivalent per year (tCO₂e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Weighted Avg Carbon Intensity – MSCI:

- Scope 1+2+3** - Calculating a portfolio's Weighted Average Carbon Intensity is achieved by calculating the carbon intensity (Scope 1 + 2 + 3 Emissions / \$M Sales) for each portfolio company and calculating the weighted average by portfolio weight. Data Treatments stated below apply.
- Scope 1** - Data Treatments stated below apply.
- Scope 2** - Data Treatments stated below

apply.

- Scope 3** - Data Treatments stated below apply.

Sovereign - Weighted Average Carbon Intensity - MSCI: Weighted Average Carbon Intensity (WACI) evaluates a portfolio's relative exposure to carbon intensive economies. Portfolio-weighted GHG emissions per sovereign GDP. (PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollars).)

Scope 1 (exclude LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (include LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Implied Temperature Rise (°C) - MSCI: The climate scenario alignment uses MSCI's Implied Temperature Rise (ITR) model, which is a forward-looking temperature alignment metric for companies and portfolios. Specifically, the MSCI ITR methodology evaluates whether a company or portfolio are aligned with the Paris Agreement temperature goals – in particular, the maximal goal of limiting global mean surface temperature to an increase of no more than 1.5°C in the year 2100 compared with preindustrial levels. For example, an ITR of 2.5°C assigned to a given portfolio would indicate that the portfolio is exceeding its fair share of the global carbon budget, and that if everyone exceeded their fair shares by a similar proportion, by 2100 we would end up in a world with >2.5°C of warming compared to pre-industrial levels. Please note there is significant uncertainty related to this temperature estimate, and outputs differ amongst different data vendors as methodologies continue to evolve and mature.

- Portfolio:** Implied Temperature Rise aggregated at the Portfolio Level. Data Treatments stated below apply.
- Benchmark:** Implied Temperature Rise aggregated at the Benchmark Level. Data Treatments stated below apply.

Climate Value at Risk- MSCI: (Climate VaR) is a measure to estimate the

potential financial losses that a company or portfolio of assets could incur as a result of climate change. It is similar to VaR, but focuses specifically on the risks and opportunities associated with climate change. Climate Value-at-Risk (Climate VaR) is designed to provide a forward-looking and return-based valuation assessment to measure climate related risks and opportunities in an investment portfolio.

- NGFS: Network for Greening the Financial System. The NGFS scenarios were developed to provide a common starting point for analyzing climate risks to the economy and financial system. It is important to note that the NGFS scenarios are not forecasts: instead, they aim at exploring the bookends of plausible futures (neither the most probable nor desirable) for financial risk assessment.
- NDC: Nationally determined contributions (NDC) embody efforts by each country to reduce national emissions and adapt to the impacts of climate change.
- REMIND: (REgional Model of Investment and Development) REMIND is an energy-economy general equilibrium model linking a macro-economic growth model with a bottom-up engineering-based energy system model. It covers twelve world regions, differentiates various energy carriers and technologies and represents the dynamics of economic growth and international trade.
- Policy Risk VaR: is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of policies related to climate change.
- Technology Opportunities VaR: is a measure to estimate which companies may be the beneficiaries if 3°C, 2°C or 1.5°C aligned climate policies are implemented on a global level.
- Physical Risk VaR: is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of physical climate risks that are either acute or chronic relating to climate change.

1.5°C Aggregated Policy Risk	Company Climate VaR (REMIND NGFS ORDERLY) [%]
A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 1.5°C target and using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	1.5°C Technology Opportunity
Company Climate VaR (REMIND NGFS ORDERLY) [%]	

A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 1.5°C target and calculated using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.
1.5°C Aggregated Physical Risk Company Climate VaR (REMIND Orderly Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 1.5°C REMIND Orderly scenario. Data treatments stated below apply.
2°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 2°C target and using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.
2°C Technology Opportunity Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 2°C target and calculated using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.
2°C Aggregated Physical Risk Company Climate VaR (REMIND Disorderly Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 2°C REMIND Disorderly scenario. Data Treatments stated below apply.
3°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS NDC) [%] A company's aggregated downside

policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 3°C target and using carbon prices from the REMIND model under the NGFS NDC scenario.

3°C Technology Opportunity Company Climate VaR (REMIND NGFS NDC) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 3°C target and calculated using carbon prices from the REMIND model under the NGFS NDC scenario. Data treatments stated below apply.	3°C Aggregated Physical Risk Company Climate VaR (REMIND NDC Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 3°C REMIND NDC scenario. Data treatments stated below apply.

Product Involvement and Controversy Profile

Portfolio Product Involvement exposure measures involvement of portfolio holdings in controversial business activities. Product Involvement areas track companies' direct involvement in certain products or services, such as production, distribution, or related services. For most business activity categories, the level of Product Involvement is indicated using revenues as a proxy. The exception is for business activities where revenue data is not relevant, in which case the level of involvement is binary — involved or not involved.

Product involvement: Drivers may include revenue thresholds, activities, and ownership relationship. To address this complexity, State Street Investment Management has created an approach to evaluating commonly screened sustainability criteria for investors who seek screened portfolios. For more information about the data, metrics, and thresholds applied to each topic, refer to [State Street Investment Management Approach to Navigate Sustainable Investing Screening: Methodology](https://www.ssga.com/library-content/assets/pdf/global/esg/2024/ssga-approach-to-esg-screening-methodology.pdf).

- Arctic Oil & Gas Exploration - Sustainability:** Measures portfolio exposure to companies involved in oil and gas exploration in Arctic regions. Data Treatments stated below apply but do not include item #2, additionally Green Bonds are excluded (applicable for FI).

Civilian Firearms - Sustainalytics and MSCI: Measures portfolio exposure to companies involved in the manufacturing and/or retailing of small arms and associated ammunition/ components for civilian use. Data Treatments stated below apply but do not include item #2.

Controversial Weapons - Sustainalytics and MSCI: Measures portfolio exposure to companies associated with controversial weapons. The following types of weapons are covered: cluster munitions, antipersonnel mines and land mines, biological and chemical weapons, nuclear weapons, depleted uranium, incendiary weapons and white phosphorus. Data Treatments stated below apply but do not include item #2.

Extreme ESG Controversies - Sustainalytics: Measures portfolio exposure to companies involved in incidents/ events that may pose business or reputational risk due to potential impacts on stakeholders, the environment, or the company's operations. Data Treatments stated below apply but do not include item #2.

Oil Sands – Sustainalytics: Measures portfolio exposure to companies that derive revenue from the extraction of oil sands. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.

Thermal Coal – Sustainalytics: Measures portfolio exposure to companies involved in the extraction or power generation of thermal coal. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.

Tobacco – Sustainalytics and MSCI: Measures portfolio exposure to companies that are involved in the production and manufacturing of tobacco and tobacco-related products (including vaping, pipes and other related products). Data Treatments stated below apply but do not include item #2.

UN Global Compact Violators – Sustainalytics: Measures portfolio exposure to companies who are in violation of UN Global Compact principles. The UN Global Compact (UNGC) is the world's largest corporate sustainability initiative. It sets forth 10 responsible business principles for companies to follow. Data Treatments stated below apply but don't include item #2.

Data Treatments: State Street applies the data treatments where applicable to Sustainability Metrics. To review the data treatments and the metrics they are applied to please see the data treatments below.

1. Exclusions: Exclude positions for specific security types that are not expected to have a score / rating. (Cash, Cash Equivalents*, Derivatives**, Rights and Warrants)
2. Exclude securities without a value for a particular metric.
3. Rebalance the position weights of covered securities.

ESG Score/ESG Rating - MSCI: Provide an opinion of sovereign and sub-sovereign entities' exposure to and management

of ESG risks. MSCI ESG Research defines ESG risks to sovereign or sub sovereign entities as environmental, social, or governance-related issues that could impact the longterm sustainability of their economies. MSCI ESG Government Ratings are determined for countries, local authorities, and supranational administrative bodies and are relative to a global peer set. Each rating takes into consideration measures of environmental risk and management, knowledge and social capital, and the strength of financial, judicial, and political systems. ESG Government Scores are calculated for all countries and then converted into a letter rating. The AAA rating represents the highest ESG Rating (i.e., lower ESG risk exposure and stronger risk management) whereas the CCC rating represents the lowest ESG Rating (i.e., higher ESG risk exposure and weaker risk management).

ESG Ratings Distribution - MSCI ESG Leaders:

- Rated AAA or AA:** Issuers(sovereign) that have strong management of financially relevant environmental, social and AA governance issues.
- ESG Average:** Rated A, BBB or BB: Issuers(sovereign) that have average management of ESG issues.
- ESG Laggards:** Rated B or CCC: Issuers(sovereign) that do not demonstrate adequate management of the financially relevant ESG risks that they face.
- ESG Not Covered:** Issuers(sovereign) which have not been evaluated for ESG sustainability risks.

Green Bonds – CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Bonds are identified as green if they meet the criteria for Climate Bonds Initiative's (CBI) green labelled database. For more information on the Green Bond Database methodology, please visit <https://www.climatebonds.net/data-insights/market-data/green-bond-dataset-methodology>

Adverse Sustainability Indicators(Weighted Average) - MSCI

- Average Income Inequality Score(Weighted):** measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution.
- Average Corruption Score(Weighted):** Perceptions of public-sector corruption, including bribery, diversion of public funds, use of public office for private gain, nepotism in the civil service, state capture and mechanisms available to prevent corruption.
- Average**

Rule of Law Score(Weighted): measures the strength and predictability of a country's legal system and institutions. Assesses factors like: Protection of property rights, Contract enforcement, Absence of corruption, Public safety and security.

Average Freedom of Expression Score(Weighted): assesses the extent to which countries and their citizens enjoy freedom of expression. It evaluates the protection and promotion of fundamental freedoms, including freedom of speech, press, assembly, and association.

Average Political Stability Score(Weighted): assesses the potential adverse impacts of investment decisions on sustainability factors. Analyzes various factors related to political stability, including government stability, internal conflict, and external conflict

Government Freedom Status MSCI:

- Free:** Countries with strong political rights and civil liberties.
- Partially Free:** Countries where some political rights and civil liberties are present, but there are challenges and limitations.
- Not Free:** Countries where political rights and civil liberties are largely absent.
- No Data:** No data available to evaluate a country's government based on political rights and civil liberties.

Sustainability Sovereign Bond Portfolio Characteristics

Green Bonds: The Climate Bonds Initiative (CBI) defines green bonds as debt instruments that finance projects with environmental benefits, and the CBI Green Bond Database uses a methodology to evaluate and categorize projects as green. The CBI's methodology includes the following criteria:

- Self-labeling:** The issuer must consciously label the instrument as a green bond.
- Public disclosure:** The issuer must provide sufficient information to determine if the financed assets are green. This includes information such as the amount outstanding and closing confirmation.
- Eligible sectors:** The financed assets must be in eligible sectors, such as energy efficient products and processes, or non-energy GHG reductions.
- Eligible use of proceeds:** The proceeds must be used for eligible purposes.

Green Bonds Portfolio - CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Data Treatments stated below apply but do not include item #2.

Green Bonds Benchmark - CBI: Market Value of Securities with Green Bond as a Percentage of the Total Market Value of all Securities in the Benchmark. Data Treatments stated below apply but do not include item #2.

Green/Fossil Fuel Based Revenue Ratio - MSCI: The Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio level and the Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio and Benchmark level. Data Treatments stated below apply, additional missing data treatment to replace nulls with zero.

Companies with SBTi Approved Targets - MSCI: The percentage of the fund's market value exposed to issuers that have carbon emissions reduction targets approved by the Science Based Targets initiative (SBTi) on both the Portfolio and Benchmark level. Data Treatments stated below apply but do not include item #2.

Low Carbon Transition Score - MSCI: Score calculates a company's climate transition risk by aggregating Scope 1, 2 and 3 emissions, emissions avoided, and the quality of the company's climate management into a score between 0 (highest risk) and 10 (lowest risk). Companies with higher Low Carbon Transition score are more aligned with the Low Carbon Transition compared to the companies with lower scores. Score calculated at both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Risk Rating- ISS: Assesses a company's ability to deal with climate change and the transition to a low carbon economy rated on a scale of 0 to 100, with 0 being

very poor and 100 being excellent. The Carbon Risk Rating provides an aggregated score indicating a company's overall climate-related risk, using the company-specific risk exposure as baseline (Carbon Risk Classification) from which a company can take steps toward better alignment with a low carbon economy (Carbon Performance score).

Weighted Average of each Underlying Security with a Carbon Risk Rating Value for both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Footprint(t CO2e/\$M EVIC):

- Scope 1+2+3- MSCI:** Weighted average of Scope 1, Scope 2 and Scope 3 carbon emissions intensity normalized by enterprise value including cash. Data Treatments stated below apply.
- Scope 1+2** - Data Treatments stated below apply.
- Scope 1** - Data Treatments stated below apply.
- Scope 2** - Data Treatments stated below apply.
- Scope 3** - Data Treatments stated below apply.

Total Carbon Emissions - MSCI: Total Carbon Emissions measures the absolute tons of CO2e EVIC for which an investor is responsible. It is apportioned to the investor based on an equity ownership perspective, and can be explained with a simple example: If an investor's position in a company is equal to 1% of the company's total market capitalization, then the investor owns 1% of the company, and is consequently responsible for 1% of the company's carbon emissions (tons CO2e). Calculating the "owned" emissions from each position in the portfolio and summing those emissions yields the total carbon emissions for the portfolio and benchmark level.

- Scope 1** emissions are "direct emissions" from sources that are owned or controlled by the company. Data Treatments stated below apply.
- Scope 2** emissions are the indirect emissions released into the atmosphere from the use of purchased energy such as electricity, heat or steam. These are called "indirect emissions" because the actual emissions are generated at another facility such as a power station. Data Treatments stated below apply.
- Scope 3** emissions include all other indirect emissions that occur across the value chain and are outside of the organization's direct control. Data Treatments stated below apply.
- Scope 1+2** - Data Treatments stated below apply.

Total Carbon Emissions is not used to compare portfolios and benchmarks because the data is not normalized. Benchmark data will not appear in this section.

Sovereign- Total Carbon Emissions – MSCI: Total carbon emissions includes all greenhouse gas emissions produced within a country's borders from all sources, including energy production, industry, agriculture, and transportation apportioned by PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollar).

Scope 1 (excluding LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/ territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/ territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (including LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Weighted Avg Carbon Intensity - MSCI:

- Scope 1+2+3 - Calculating a portfolio's Weighted Average Carbon Intensity is achieved by calculating the carbon intensity (Scope 1 + 2 + 3 Emissions / \$M Sales) for each portfolio company and calculating the weighted average by portfolio weight. Data Treatments stated below apply.
- Scope 1 - Data Treatments stated below apply.
- Scope 2 - Data Treatments stated below apply.
- Scope 3 - Data Treatments stated below apply.

Sovereign - Weighted Average Carbon Intensity - MSCI: Weighted Average Carbon Intensity (WACI) evaluates a portfolio's relative exposure to carbon intensive economies. Portfolio-weighted GHG emissions per sovereign GDP. (PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollars.))

Scope 1 (exclude LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/ territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/ territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (include LULUCF) –

MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country/ territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Implied Temperature Rise (°C) – MSCI: The climate scenario alignment uses MSCI's Implied Temperature Rise (ITR) model, which is a forward-looking temperature alignment metric for companies and portfolios. Specifically, the MSCI ITR methodology evaluates whether a company or portfolio are aligned with the Paris Agreement temperature goals – in particular, the maximal goal of limiting global mean surface temperature to an increase of no more than 1.5°C in the year 2100 compared with preindustrial levels. For example, an ITR of 2.5°C assigned to a given portfolio would indicate that the portfolio is exceeding its fair share of the global carbon budget, and that if everyone exceeded their fair shares by a similar proportion, by 2100 we would end up in a world with >2.5°C of warming compared to pre-industrial levels. Please note there is significant uncertainty related to this temperature estimate, and outputs differ amongst different data vendors as methodologies continue to evolve and mature.

- Portfolio:** Implied Temperature Rise aggregated at the Portfolio Level. Data Treatments stated below apply.
- Benchmark:** Implied Temperature Rise aggregated at the Benchmark Level. Data Treatments stated below apply.

Climate Value at Risk- MSCI: (Climate VaR): is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of climate change. It is similar to VaR, but focuses specifically on the risks and opportunities associated with climate change. Climate Value-at-Risk (Climate VaR) is designed to provide a forward-looking and return-based valuation assessment to measure climate related risks and opportunities in an investment portfolio.

- NGFS:** Network for Greening the Financial System. The NGFS scenarios were developed to provide a common starting point for analyzing climate risks to the economy and financial system. It is important to note that the NGFS scenarios are not forecasts: instead, they aim at exploring the bookends of plausible futures (neither the most probable nor desirable) for financial risk assessment.
- NDC:** Nationally determined

contributions(NDC) embody efforts by each country to reduce national emissions and adapt to the impacts of climate change.

- REMIND: (REgional Model of Investment and Development) REMIND is an energy-economy general equilibrium model linking a macro-economic growth model with a bottom-up engineering-based energy system model. It covers twelve world regions, differentiates various energy carriers and technologies and represents the dynamics of economic growth and international trade.
- Policy Risk VaR: is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of policies related to climate change.
- Technology Opportunities VaR: is a measure to estimate which companies may be the beneficiaries if 3°C, 2°C or 1.5°C aligned climate policies are implemented on a global level.
- Physical Risk VaR: is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of physical climate risks that are either acute or chronic relating to climate change.

1.5°C Aggregated Policy Risk	Company Climate VaR (REMIND NGFS ORDERLY) [%]
A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 1.5°C target and using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	
1.5°C Technology Opportunity	Company Climate VaR (REMIND NGFS ORDERLY) [%]
A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 1.5°C target and calculated using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	
1.5°C Aggregated Physical Risk	Company Climate VaR (REMIND Orderly Average outcome) [%]
A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 1.5°C REMIND	

Orderly scenario. Data treatments stated below apply.

2°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 2°C target and using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.	2°C Technology Opportunity Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 2°C target and calculated using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.
2°C Aggregated Physical Risk Company Climate VaR (REMIND Disorderly Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 2°C REMIND Disorderly scenario. Data Treatments stated below apply.	3°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS NDC) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 3°C target and using carbon prices from the REMIND model under the NGFS NDC scenario.
3°C Aggregated Physical Risk Company Climate VaR (REMIND NGFS NDC) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value capped at 100%, assuming a global 3°C target and calculated using carbon prices from the REMIND model under the NGFS NDC scenario. Data treatments stated below apply.	3°C Technology Opportunity Company Climate VaR (REMIND NGFS NDC) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 3°C target and calculated using carbon prices from the REMIND model under the NGFS NDC scenario. Data treatments stated below apply.

Company Climate VaR (REMIND NDC Average outcome) [%]	A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 3°C REMIND NDC scenario. Data treatments stated below apply.

Product Involvement and Controversy Profile

Portfolio Product Involvement exposure measures involvement of portfolio holdings in controversial business activities. Product Involvement areas track companies' direct involvement in certain products or services, such as production, distribution, or related services. For most business activity categories, the level of Product Involvement is indicated using revenues as a proxy. The exception is for business activities where revenue data is not relevant, in which case the level of involvement is binary — involved or not involved.

Product involvement: Drivers may include revenue thresholds, activities, and ownership relationship. To address this complexity, State Street Investment Management has created an approach to evaluating commonly screened sustainability criteria for investors who seek screened portfolios. For more information about the data, metrics, and thresholds applied to each topic, refer to [State Street Investment Management Approach to Navigate Sustainable Investing Screening: Methodology](https://www.ssga.com/library-content/assets/pdf/global/esg/2024/ssga-approach-to-esg-screening-methodology.pdf).

- Arctic Oil & Gas Exploration - Sustainalytics:** Measures portfolio exposure to companies involved in oil and gas exploration in Arctic regions. Data Treatments stated below apply but do not include item #2, additionally Green Bonds are excluded (applicable for FI).
- Civilian Firearms - Sustainalytics and MSCI:** Measures portfolio exposure to companies involved in the manufacturing and/or retailing of small arms and associated ammunition/ components for civilian use. Data Treatments stated below apply but do not include item #2.
- Controversial Weapons - Sustainalytics and MSCI:** Measures portfolio exposure to companies associated with controversial weapons. The following types of weapons are covered: cluster munitions, antipersonnel mines and land mines, biological and chemical weapons, nuclear weapons, depleted uranium, incendiary weapons and white phosphorus. Data Treatments stated below apply but do not include item #2.
- Extreme ESG Controversies - Sustainalytics:** Measures portfolio exposure to companies involved in incidents/ events that may pose business or reputational

risk due to potential impacts on stakeholders, the environment, or the company's operations. Data Treatments stated below apply but do not include item #2.

- Oil Sands – Sustainalytics:** Measures portfolio exposure to companies that derive revenue from the extraction of oil sands. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.
- Thermal Coal – Sustainalytics:** Measures portfolio exposure to companies involved in the extraction or power generation of thermal coal. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.
- Tobacco – Sustainalytics and MSCI:** Measures portfolio exposure to companies that are involved in the production and manufacturing of tobacco and tobacco-related products (including vaping, pipes and other related products). Data Treatments stated below apply but do not include item #2.
- UN Global Compact Violators – Sustainalytics:** Measures portfolio exposure to companies who are in violation of UN Global Compact principles. The UN Global Compact (UNGC) is the world's largest corporate sustainability initiative. It sets forth 10 responsible business principles for companies to follow. Data Treatments stated below apply but don't include item #2.

Data Treatments: State Street applies the data treatments where applicable to Sustainability Metrics. To review the data treatments and the metrics they are applied to please see the data treatments below.

- Exclusions: Exclude positions for specific security types that are not expected to have a score / rating. (Cash, Cash Equivalents*, Derivatives**, Rights and Warrants)
- Exclude securities without a value for a particular metric.
- Rebalance the position weights of covered securities.

ESG Score/ESG Rating - MSCI: Provide an opinion of sovereign and sub-sovereign entities' exposure to and management of ESG risks. MSCI ESG Research defines ESG risks to sovereign or sub-sovereign entities as environmental, social, or governance-related issues that could impact the longterm sustainability of their economies. MSCI ESG Government Ratings are determined for countries, local authorities, and supranational administrative bodies and are relative to a global peer set. Each rating takes into consideration measures of environmental risk and management, knowledge and social capital, and the strength of financial, judicial, and political systems. ESG Government Scores are calculated for all countries and then converted into a letter rating. The AAA rating represents the highest ESG Rating (i.e., lower ESG risk exposure and stronger risk management) whereas the CCC rating represents the lowest ESG Rating (i.e., higher ESG risk exposure and weaker risk management).

ESG Ratings Distribution - MSCI ESG Leaders:

0px 0px 20px\ "><p class=\ "text-sm\ ">Rated AAA or AA: Issuers(sovereign) that have strong management of financially relevant environmental, social and AA governance issues.</p>\n <li style=\ "padding: 0px 0px 0px 20px\ "><p class=\ "text-sm\ ">ESG Average: Rated A, BBB or BB: Issuers(sovereign) that have average management of ESG issues.</p>\n <li style=\ "padding: 0px 0px 0px 20px\ "><p class=\ "text-sm\ ">ESG Laggards: Rated B or CCC: Issuers(sovereign) that do not demonstrate adequate management of the financially relevant ESG risks that they face.</p>\n <li style=\ "padding: 0px 0px 0px 20px\ "><p class=\ "text-sm\ ">ESG Not Covered: Issuers(sovereign) which have not been evaluated for ESG sustainability risks.</p>\n \n <p class=\ "text-sm\ "><strong style=\ "text-decoration:underline\ ">Green Bonds – CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Bonds are identified as green if they meet the criteria for Climate Bonds Initiative's (CBI) green labelled database. For more information on the Green Bond Database methodology, please visit https://www.climatebonds.net/data-insights/market-data/green-bond-dataset-methodology</p>\n
\n <p class=\ "text-sm\ "><strong style=\ "text-decoration:underline\ ">Adverse Sustainability Indicators(Weighted Average) - MSCI</p>\n <ul style=\ "list-style-type: none\ ">\n <li style=\ "padding: 0px 0px 0px 20px\ "><p class=\ "text-sm\ ">Average Income Inequality Score(Weighted): measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution.</p>\n <li style=\ "padding: 0px 0px 0px 20px\ "><p class=\ "text-sm\ ">Average Corruption Score(Weighted): Perceptions of public-sector corruption, including bribery, diversion of public funds, use of public office for private gain, nepotism in the civil service, state capture and mechanisms available to prevent corruption.</p>\n <li style=\ "padding: 0px 0px 0px 20px\ "><p class=\ "text-sm\ ">Average Rule of Law Score(Weighted): measures the strength and predictability of a country's legal system and institutions. Assesses factors like: Protection of property rights, Contract enforcement, Absence of corruption, Public safety and security.</p>\n <li style=\ "padding: 0px 0px 0px 20px\ "><p class=\ "text-sm\ ">Average Freedom of Expression Score(Weighted): assesses the extent to which countries and their citizens enjoy freedom of expression. It evaluates the protection and promotion of fundamental freedoms, including freedom of speech, press, assembly, and association.</p>\n <li style=\ "padding: 0px 0px 0px 20px\ "><p class=\ "text-sm\ ">Average Political Stability Score(Weighted): assesses the potential adverse impacts of investment decisions on sustainability factors. Analyzes various factors related to political stability, including government stability, internal conflict, and external conflict</p>\n \n

MSCI has established an information barrier between index research and certain Information. None of the Information in and of itself can be used to determine which securities to buy or sell or when to buy or sell them. The Information is provided "as is" and the user assumes the entire risk of any use it may make or permit to be made of the Information. No MSCI Party warrants or guarantees the originality, accuracy and/or completeness of the Information and each expressly disclaims all express or implied warranties. No MSCI Party shall have any liability for any errors or omissions in connection with any Information herein, or any liability for any direct, indirect, special, punitive, consequential or any other damages (including lost profits) even if notified of the possibility of such damages.

The returns on a portfolio of securities which exclude companies that do not meet the portfolio's specified Sustainable Investment criteria may trail the returns on a portfolio of securities which include such companies. A portfolio's Sustainable Investment criteria may result in the portfolio investing in industry sectors or securities which underperform the market as a whole.

prose-headings:mt-[25px] prose-p:text-navy-u11 mt-[25px] glossary-
content\">\n <h2>Glossary</h2>\n <p><h4>Climate Metrics</h4></p>\n
<br>\n <p class=\"text-sm\">Sustainability data is as of the date identified in
the report sections above, usually on a month lag. All metrics are reported in
USD unless otherwise stated.</p>\n <br>\n <p class=\"text-
sm\"><strong>Portfolio Coverage</strong> is dependent upon the universe
covered by State Street Investment Management's external providers. For
certain markets and types of companies, there may be significant limitations in
the availability of data, or in some cases, no data may be available at all. In such
instances, the benchmark index provider, investment manager, an affiliate of
the investment manager or another party may use data from a related entity as
a proxy or generate estimated data to fill these gaps.</p>\n <p class=\"text-
sm\">Data treatments stated below apply but do not include item #2.</p>\n
<br>\n <p class=\"text-sm\"><strong style=\"text-
decoration:underline\">Green Revenue - MSCI:</strong> Weighted Average of
each Underlying Security with Green Revenue for the portfolio and benchmark
level. Data Treatments stated below apply.</p>\n <p class=\"text-
sm\"><strong style=\"text-decoration:underline\">Brown Revenue:</strong>
Percentage of revenue from \"brown\" sectors and activities, including fossil
fuel extractions, mining, operations, and power generation, employing MSCI
revenue indicators. Brown revenue (%) is defined as the proportion of revenues
a company derives from activities related to the extraction of fossil fuels, or
power generation using fossil fuel-based energy sources. It reflects firms tied

```

to conventional energy value chains.

- Brown Revenue Portfolio - MSCI:** Weighted Average of each Underlying Security with Brown Revenue for the Portfolio. Data Treatments stated below apply.
- Brown Revenue Benchmark - MSCI:** Weighted Average of each Underlying Security with Brown Revenue for the Benchmark. Data Treatments stated below apply.

Potential Emissions - MSCI: Sum of Weighted Average Total Potential Emission of Fossil Fuel Reserves Normalized by EVIC \$MN (ktCO₂-eq per \$MN invested) on Portfolio and Benchmark Level. Data Treatments stated below apply.

Green Bonds: The Climate Bonds Initiative (CBI) defines green bonds as debt instruments that finance projects with environmental benefits, and the CBI Green Bond Database uses a methodology to evaluate and categorize projects as green. The CBI's methodology includes the following criteria:

- Self-labeling:** The issuer must consciously label the instrument as a green bond.
- Public disclosure:** The issuer must provide sufficient information to determine if the financed assets are green. This includes information such as the amount outstanding and closing confirmation.
- Eligible sectors:** The financed assets must be in eligible sectors, such as energy efficient products and processes, or non-energy GHG reductions.
- Eligible use of proceeds:** The proceeds must be used for eligible purposes.
- Green Bonds Portfolio - CBI:** Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Data Treatments stated below apply but do not include item #2.
- Green Bonds Benchmark - CBI:** Market Value of Securities with Green Bond as a Percentage of the Total Market Value of all Securities in the Benchmark. Data Treatments stated below apply but do not include item #2.

Green/Fossil Fuel Based Revenue Ratio - MSCI: The Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio level and the Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio and Benchmark level. Data Treatments stated below apply, additional missing data treatment to replace nulls with zero.

Companies with SBTi Approved Targets - MSCI: The percentage of the fund's market value exposed to issuers that have carbon emissions reduction targets approved by the Science Based Targets initiative (SBTi) on both the Portfolio and Benchmark

level. Data Treatments stated below apply but do not include item #2.

Low Carbon Transition Score - MSCI: Score calculates a company's climate transition risk by aggregating Scope 1, 2 and 3 emissions, emissions avoided, and the quality of the company's climate management into a score between 0 (highest risk) and 10 (lowest risk). Companies with higher Low Carbon Transition score are more aligned with the Low Carbon Transition compared to the companies with lower scores. Score calculated at both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Risk Rating- ISS: Assesses a company's ability to deal with climate change and the transition to a low-carbon economy rated on a scale of 0 to 100, with 0 being very poor and 100 being excellent. The Carbon Risk Rating provides an aggregated score indicating a company's overall climate-related risk, using the company-specific risk exposure as baseline (Carbon Risk Classification) from which a company can take steps toward better alignment with a low carbon economy (Carbon Performance score).

Weighted Average of each Underlying Security with a Carbon Risk Rating Value for both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Footprint(t CO2e/\$M EVIC):

- Scope 1+2+3- MSCI: Weighted average of Scope 1, Scope 2 and Scope 3 carbon emissions intensity normalized by enterprise value including cash. Data Treatments stated below apply.
- Scope 1+2 - Data Treatments stated below apply.
- Scope 1 - Data Treatments stated below apply.
- Scope 2 - Data Treatments stated below apply.
- Scope 3 - Data Treatments stated below apply.

Total Carbon Emissions - MSCI: Total Carbon Emissions measures the absolute tons of CO2e EVIC for which an investor is responsible. It is apportioned to the investor based on an equity ownership perspective, and can be explained with a simple example: If an investor's position in a company is equal to 1% of the company's total market capitalization, then the investor owns 1% of the company, and is consequently responsible for 1% of the company's carbon emissions (tons CO2e). Calculating the "owned" emissions from each position in the portfolio and summing those emissions yields the total carbon emissions for the portfolio and benchmark level.

- Scope 1 emissions are "direct emissions" from sources that are owned or controlled by the company. Data Treatments stated below apply.
- Scope 2 emissions are the

indirect emissions released into the atmosphere from the use of purchased energy such as electricity, heat or steam. These are called "indirect emissions" because the actual emissions are generated at another facility such as a power station. Data Treatments stated below apply.

- Scope 3 emissions include all other indirect emissions that occur across the value chain and are outside of the organization's direct control. Data Treatments stated below apply.
- Scope 1+2 - Data Treatments stated below apply.

Total Carbon Emissions is not used to compare portfolios and benchmarks because the data is not normalized. Benchmark data will not appear in this section.

Sovereign- Total Carbon Emissions – MSCI:

Total carbon emissions includes all greenhouse gas emissions produced within a country's borders from all sources, including energy production, industry, agriculture, and transportation apportioned by PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollar).

Scope 1 (excluding LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (including LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Weighted Avg Carbon Intensity - MSCI:

- Scope 1+2+3 - Calculating a portfolio's Weighted Average Carbon Intensity is achieved by calculating the carbon intensity (Scope 1 + 2 + 3 Emissions / \$M Sales) for each portfolio company and calculating the weighted average by portfolio weight. Data Treatments stated below apply.
- Scope 1 - Data Treatments stated below apply.
- Scope 2 - Data Treatments stated below apply.
- Scope 3 - Data Treatments stated below apply.

li>\n \n <p class="text-sm"><strong style="text-decoration:underline">Sovereign - Weighted Average Carbon Intensity - MSCI: Weighted Average Carbon Intensity (WACI) evaluates a portfolio's relative exposure to carbon intensive economies. Portfolio-weighted GHG emissions per sovereign GDP. (PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollars.)</p>\n <p class="text-sm">Scope 1 (exclude LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). \n <p class="text-sm"><strong style="text-decoration:underline">Implied Temperature Rise (°C) - MSCI: The climate scenario alignment uses MSCI's Implied Temperature Rise (ITR) model, which is a forward-looking temperature alignment metric for companies and portfolios. Specifically, the MSCI ITR methodology evaluates whether a company or portfolio are aligned with the Paris Agreement temperature goals – in particular, the maximal goal of limiting global mean surface temperature to an increase of no more than 1.5°C in the year 2100 compared with preindustrial levels. For example, an ITR of 2.5°C assigned to a given portfolio would indicate that the portfolio is exceeding its fair share of the global carbon budget, and that if everyone exceeded their fair shares by a similar proportion, by 2100 we would end up in a world with >2.5°C of warming compared to pre-industrial levels. Please note there is significant uncertainty related to this temperature estimate, and outputs differ amongst different data vendors as methodologies continue to evolve and mature.</p>\n <ul style="list-style-type: none">\n <li style="padding: 0px 0px 0px 20px"><p class="text-sm">Portfolio: Implied Temperature Rise aggregated at the Portfolio Level. Data Treatments stated below apply.</p>\n <li style="padding: 0px 0px 0px 20px"><p class="text-sm">Benchmark: Implied Temperature Rise aggregated at the Benchmark Level. Data Treatments stated below apply.</p>\n \n <p class="text-sm"><strong style="text-decoration:underline">Climate Value at Risk- MSCI: (Climate VaR): is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of climate change. It is similar to VaR, but focuses specifically on the

risks and opportunities associated with climate change. Climate Value-at-Risk (Climate VaR) is designed to provide a forward-looking and return-based valuation assessment to measure climate related risks and opportunities in an investment portfolio.

- NGFS:** Network for Greening the Financial System. The NGFS scenarios were developed to provide a common starting point for analyzing climate risks to the economy and financial system. It is important to note that the NGFS scenarios are not forecasts: instead, they aim at exploring the bookends of plausible futures (neither the most probable nor desirable) for financial risk assessment.
- NDC:** Nationally determined contributions (NDC) embody efforts by each country to reduce national emissions and adapt to the impacts of climate change.
- REMIND:** (REgional Model of Investment and Development) REMIND is an energy-economy general equilibrium model linking a macro-economic growth model with a bottom-up engineering-based energy system model. It covers twelve world regions, differentiates various energy carriers and technologies and represents the dynamics of economic growth and international trade.
- Policy Risk VaR:** is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of policies related to climate change.
- Technology Opportunities VaR:** is a measure to estimate which companies may be the beneficiaries if 3°C, 2°C or 1.5°C aligned climate policies are implemented on a global level.
- Physical Risk VaR:** is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of physical climate risks that are either acute or chronic relating to climate change.

1.5°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS ORDERLY) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 1.5°C target and using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	1.5°C Technology Opportunity Company Climate VaR (REMIND NGFS ORDERLY) [%] A company's upside technology opportunity exposure, expressed as a
---	---

percentage of the company's market value capped at 100%, assuming a global 1.5°C target and calculated using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.

1.5°C Aggregated Physical Risk Company Climate VaR (REMIND Orderly Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 1.5°C REMIND Orderly scenario. Data treatments stated below apply.	2°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 2°C target and using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.
2°C Technology Opportunity Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 2°C target and calculated using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.	2°C Aggregated Physical Risk Company Climate VaR (REMIND Disorderly Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 2°C REMIND Disorderly scenario. Data Treatments stated below apply.
3°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS NDC) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global	

3°C target and using carbon prices from the REMIND model under the NGFS NDC scenario.	3°C Technology Opportunity
Company Climate VaR (REMIND NGFS NDC) [%]	A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 3°C target and calculated using carbon prices from the REMIND model under the NGFS NDC scenario. Data treatments stated below apply.
3°C Aggregated Physical Risk	Company Climate VaR (REMIND NDC Average outcome) [%]
A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 3°C REMIND NDC scenario. Data treatments stated below apply.	

Product Involvement and Controversy Profile

Portfolio Product Involvement exposure measures involvement of portfolio holdings in controversial business activities. Product Involvement areas track companies' direct involvement in certain products or services, such as production, distribution, or related services. For most business activity categories, the level of Product Involvement is indicated using revenues as a proxy. The exception is for business activities where revenue data is not relevant, in which case the level of involvement is binary — involved or not involved.

Product involvement: Drivers may include revenue thresholds, activities, and ownership relationship. To address this complexity, State Street Investment Management has created an approach to evaluating commonly screened sustainability criteria for investors who seek screened portfolios. For more information about the data, metrics, and thresholds applied to each topic, refer to <https://www.ssga.com/library-content/assets/pdf/global/esg/2024/ssga-approach-to-esg-screening-methodology.pdf> State Street Investment Management Approach to Navigate Sustainable Investing Screening: Methodology.

- Arctic Oil & Gas Exploration - Sustainalytics:** Measures portfolio exposure to companies involved in oil and gas exploration in Arctic regions. Data Treatments stated below apply but do not include item #2, additionally Green Bonds are excluded (applicable for FI).
- Civilian Firearms - Sustainalytics and MSCI:** Measures portfolio exposure to companies involved in the manufacturing and/or retailing

of small arms and associated ammunition/ components for civilian use. Data Treatments stated below apply but do not include item #2.

- Controversial Weapons - Sustainalytics and MSCI:** Measures portfolio exposure to companies associated with controversial weapons. The following types of weapons are covered: cluster munitions, antipersonnel mines and land mines, biological and chemical weapons, nuclear weapons, depleted uranium, incendiary weapons and white phosphorus. Data Treatments stated below apply but do not include item #2.
- Extreme ESG Controversies - Sustainalytics:** Measures portfolio exposure to companies involved in incidents/ events that may pose business or reputational risk due to potential impacts on stakeholders, the environment, or the company's operations. Data Treatments stated below apply but do not include item #2.
- Oil Sands – Sustainalytics:** Measures portfolio exposure to companies that derive revenue from the extraction of oil sands. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.
- Thermal Coal – Sustainalytics:** Measures portfolio exposure to companies involved in the extraction or power generation of thermal coal. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.
- Tobacco – Sustainalytics and MSCI:** Measures portfolio exposure to companies that are involved in the production and manufacturing of tobacco and tobacco-related products (including vaping, pipes and other related products). Data Treatments stated below apply but do not include item #2.
- UN Global Compact Violators – Sustainalytics:** Measures portfolio exposure to companies who are in violation of UN Global Compact principles. The UN Global Compact (UNGC) is the world's largest corporate sustainability initiative. It sets forth 10 responsible business principles for companies to follow. Data Treatments stated below apply but don't include item #2.

Data Treatments: State Street applies the data treatments where applicable to Sustainability Metrics. To review the data treatments and the metrics they are applied to please see the data treatments below.

- Exclusions:** Exclude positions for specific security types that are not expected to have a score / rating. (Cash, Cash Equivalents*, Derivatives**, Rights and Warrants)
- Exclude securities without a value for a particular metric.
- Rebalance the position weights of covered securities.

ESG Score/ESG Rating - MSCI: Provide an opinion of sovereign and sub-sovereign entities' exposure to and management of ESG risks. MSCI ESG Research defines ESG risks to sovereign or sub-sovereign entities as environmental, social, or governance-related issues that

could impact the longterm sustainability of their economies. MSCI ESG Government Ratings are determined for countries, local authorities, and supranational administrative bodies and are relative to a global peer set. Each rating takes into consideration measures of environmental risk and management, knowledge and social capital, and the strength of financial, judicial, and political systems. ESG Government Scores are calculated for all countries and then converted into a letter rating. The AAA rating represents the highest ESG Rating (i.e., lower ESG risk exposure and stronger risk management) whereas the CCC rating represents the lowest ESG Rating (i.e., higher ESG risk exposure and weaker risk management).

ESG Ratings Distribution - MSCI ESG Leaders:

- Rated AAA or AA:** Issuers(sovereign) that have strong management of financially relevant environmental, social and AA governance issues.
- ESG Average:** Rated A, BBB or BB: Issuers(sovereign) that have average management of ESG issues.
- ESG Laggards:** Rated B or CCC: Issuers(sovereign) that do not demonstrate adequate management of the financially relevant ESG risks that they face.
- ESG Not Covered:** Issuers(sovereign) which have not been evaluated for ESG sustainability risks.

Green Bonds – CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Bonds are identified as green if they meet the criteria for Climate Bonds Initiative's (CBI) green labelled database. For more information on the Green Bond Database methodology, please visit <https://www.climatebonds.net/data-insights/market-data/green-bond-dataset-methodology>

Adverse Sustainability Indicators(Weighted Average) - MSCI

- Average Income Inequality Score(Weighted):** measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution.
- Average Corruption Score(Weighted):** Perceptions of public-sector corruption, including bribery, diversion of public funds, use of public office for private gain, nepotism in the civil service, state capture and mechanisms available to prevent corruption.
- Average Rule of Law Score(Weighted):** measures the strength and predictability of a country's legal system and institutions. Assesses factors like:

Protection of property rights, Contract enforcement, Absence of corruption, Public safety and security.

- Average Freedom of Expression Score(Weighted): assesses the extent to which countries and their citizens enjoy freedom of expression. It evaluates the protection and promotion of fundamental freedoms, including freedom of speech, press, assembly, and association.
- Average Political Stability Score(Weighted): assesses the potential adverse impacts of investment decisions on sustainability factors. Analyzes various factors related to political stability, including government stability, internal conflict, and external conflict

Government Freedom Status MSCI:

- Free: Countries with strong political rights and civil liberties.
- Partially Free: Countries where some political rights and civil liberties are present, but there are challenges and limitations.
- Not Free: Countries where political rights and civil liberties are largely absent.
- No Data: No data available to evaluate a country's government based on political rights and civil liberties.

```

Profile</p><p class='text-sm'>R-Factor is a sustainability score developed by State Street Investment Management that leverages multiple data sources and aligns them to the widely accepted, transparent Sustainability Accounting Standards Board Materiality Framework for over 12,000 publicly listed companies. State Street Investment Management uses R-Factor™ as a quantitative input to a variety of investment solutions and as a metric in relevant reports and factsheets. The score is powered by sustainability data from three different providers (Sustainalytics, ISS-ESG, and Refinitiv), in order to improve overall coverage and remove biases inherent in existing scoring methodologies.</p><p class='text-sm'>R-Factor Scores are comparable across industries. A uniform grading scale allows for interpretation of the company level score to allow for comparison across companies.</p><p class='text-sm'>The R-Factor scoring process is based on the framework published by the Sustainability Accounting Standards Board ("SASB"). The SASB framework attempts to identify sustainability risks that are financially material to the issuer-based on its industry classification. R-Factor scores are determined using only those metrics from the sustainability data providers that specifically address sustainability risks identified by the SASB framework as being financially material to the issuer-based on its industry classification.</p><p class='text-

R-Factor Profile: Within each industry group, issuers are classified into five distinct sustainability performance groups based on which percentile their R-Factor scores fall into. A company is classified in one of the five sustainability performance classes (Laggard - 10% of universe, Underperformer - 20% of universe, Average Performer - 40% of universe, Outperformer - 20% of universe or Leader - 10% of universe) by comparing the company's R-Factor score against a band. R-Factor scores are normally distributed using normalized ratings on a 0-100 rating scale.

Discrepancy between the number of holdings in the R-Factor Summary versus the number of holdings in the regular reporting package may arise as the R-Factor Summary is counted based on number of issuers rather than number of holdings in the portfolio.

R-Factor: R-Factor scores are powered by three different datasets (Sustainalytics, ISS-ESG, and Refinitiv) to achieve better global coverage and remove biases inherent in any one existing scoring methodology.

R-Factor Score: Weighted Average of each Underlying Security with a R-Factor Score for the Portfolio/Benchmark. Data Treatments stated below apply.

R-Factor Securities Coverage: Total Number of Securities with R-Factor in Portfolio. Data Treatments stated below apply but do not include item #2.

- Percent of Total Securities:** Number of Securities with a R-Factor Score as a Percentage of the Total Number of all Securities in the Portfolio.

- Percent of Total Market Value:** Market Value of Securities with a R-Factor Score as a Percentage of the Total Market Value of all Securities in the Portfolio.

Top 5/Bottom 5 R-Factor Holdings & Top 10 Positions

- Portfolio Weight:** Market Value of Securities with a R-Factor Score as a Percentage of the Total Market Value of all Securities in the Portfolio.

- Benchmark Weight:** Market Value of Securities with a R-Factor Score as a Percentage of the Total Market Value of all Securities in the Benchmark.

- R-Factor Scores:** Maximum & Minimum R-Factor scores (0-100)

Characteristics of R-Factor Scores: R-Factor scores are normally distributed using normalized ratings on a 0-100 rating scale. The R-Factor Scores are comparable across industries. Based on the historical time-series of R-Factor scores, we have developed the corresponding performance grading scale.

R-Factor Profile of the Fund: This grading scale follows the normal distribution and allows for interpretation of the final company level

score to allow for comparison across companies. Data Treatments stated below apply but do not include item #2.

- R-Factor Laggard:** Bottom 10% of total R-Factor Universe. Market Value of Securities with a Qualitative Rating of "Laggard" as a Percentage of the Total Market Value of Securities in the Portfolio.
- R-Factor Underperformer:** Following 20% of total R-Factor universe. Market Value of Securities with a Qualitative Rating of "Underperformer" as a Percentage of the Total Market Value of Securities in the Portfolio.
- R-Factor Average Performer:** middle 40% of total R-Factor universe. Market Value of Securities with a Qualitative Rating of "Average" as a Percentage of the Total Market Value of Securities in the Portfolio.
- R-Factor Outperformer:** following 20% of R-Factor universe. Market Value of Securities with a Qualitative Rating of "Outperformer" as a Percentage of the Total Market Value of Securities in the Portfolio.
- R-Factor Leader:** top 10% of total R-Factor universe. Market Value of Securities with a Qualitative Rating of "Leader" as a Percentage of the Total Market Value of Securities in the Portfolio.
- Not Available:** Market Value of Securities with a Qualitative Rating of Not Available as a Percentage of the Total Market Value of Securities in the Portfolio.

  "disclaimers_draft": [
    {
      "culture": "Default",
      "disclaimer": "<p><strong>R-Factor™ Profile</strong></p><p><strong>R-Factor</strong> is a sustainability score developed by State Street Global Advisors that leverages multiple data sources and aligns them to the widely accepted, transparent Sustainability Accounting Standards Board Materiality Framework for over 12,000 publicly listed companies. SSGA uses RFactor™ as a quantitative input to a variety of investment solutions and as a metric in relevant reports and factsheets. The score is powered by sustainability data from three different providers (Sustainalytics, ISS-ESG, and Refinitiv), in order to improve overall coverage and remove biases inherent in existing scoring methodologies.</p><p>R-Factor Scores are comparable across industries. A uniform grading scale allows for interpretation of the company level score to allow for comparison across companies.</p><p>The R-Factor scoring process is based on the framework published by the Sustainability Accounting Standards Board ("SASB"). The SASB framework attempts to identify sustainability risks that are financially material to the issuer-based on its industry classification. R-Factor scores are determined using only those metrics from the sustainability data providers that specifically

```

address sustainability risks identified by the SASB framework as being financially material to the issuer-based on its industry classification.

R-Factor Profile Within each industry group, issuers are classified into five distinct sustainability performance groups based on which percentile their R-Factor scores fall into. A company is classified in one of the five sustainability performance classes (Laggard - 10% of universe, Underperformer - 20% of universe, Average Performer - 40% of universe, Outperformer - 20% of universe or Leader - 10% of universe) by comparing the company's RFactor score against a band. R-Factor scores are normally distributed using normalized ratings on a 0-100 rating scale.

Discrepancy between the number of holdings in the R-Factor Summary versus the number of holdings in the regular reporting package may arise as the R-Factor Summary is counted based on number of issuers rather than number of holdings in the portfolio.

R-Factor: R-Factor scores are powered by three different datasets (Sustainalytics, ISS-ESG, and Refinitiv) to achieve better global coverage and remove biases inherent in any one existing scoring methodology.

R-Factor Score: Weighted Average of each Underlying Security with a R-Factor Score for the Portfolio/Benchmark. Data Treatments stated below apply.

R-Factor Securities Coverage: Total Number of Securities with R-Factor in Portfolio. Data Treatments stated below apply but do not include item #2.

Percent of Total Securities: Number of Securities with a R-Factor Score as a Percentage of the Total Number of all Securities in the Portfolio.

Percent of Total Market Value: Market Value of Securities with a R-Factor Score as a Percentage of the Total Market Value of all Securities in the Portfolio.

Portfolio Weight: Market Value of Securities with a R-Factor Score as a Percentage of the Total Market Value of all Securities in the Portfolio.

Benchmark Weight: Market Value of Securities with a R-Factor Score as a Percentage of the Total Market Value of all Securities in the Benchmark.

R-Factor Scores: Maximum & Minimum R-Factor scores (0-100)

Characteristics of R-Factor Scores: R-Factor scores are normally distributed using normalized ratings on a 0–100 rating scale. The R-Factor Scores are comparable across industries. Based on the historical time-series of R-Factor scores, we have developed the corresponding performance grading scale.

R-Factor Profile of the Fund: This grading scale follows the normal distribution and allows for interpretation of the final company level score to allow for comparison across companies. Data Treatments stated below apply but do not include item #2.

- R-Factor Laggard** - Bottom 10% of total R-Factor Universe. Market Value of Securities with a Qualitative Rating of "Laggard" as a Percentage of the Total Market Value of Securities in the Portfolio.
- R-Factor Underperformer** - Following 20% of total R-Factor universe. Market Value of Securities with a Qualitative Rating of "Underperformer" as a Percentage of the Total Market Value of Securities in the Portfolio.
- R-Factor Average** - middle 40% of total R-Factor universe. Market Value of Securities with a Qualitative Rating of

      "disclaimer": "<p><strong>Total Carbon Emissions -
MSCI: </strong>Total Carbon Emissions measures the absolute tons of 002e
EVIO for which an investor is responsible. It is apportioned to the investor
based on an equity ownership perspective, and can be explained with a simple
example: If an investor's position in a company is equal to 1% of the company's
total market capitalization, then the investor owns 1% of the company, and is
consequently responsible for 1% of the company's carbon emissions (tons
002e). Calculating the \"owned\" emissions from each position in the portfolio
and summing those emissions yields the total carbon emissions for the
portfolio and benchmark level.</p><ul><li><strong>Scope 1</strong>

strong> Weighted Average of each Underlying Security with Brown Revenue for

```

the Benchmark. Data Treatments stated below apply.

- Potential Emissions - MSCI:** Sum of Weighted Average Total Potential Emission of Fossil Fuel Reserves Normalized by EVIC \$MN (ktCO₂-eq per \$MN invested) on Portfolio and Benchmark Level. Data Treatments stated below apply.
 - Green Bonds:** The Climate Bonds Initiative (CBI) defines green bonds as debt instruments that finance projects with environmental benefits, and the CBI Green Bond Database uses a methodology to evaluate and categorize projects as green. The CBI's methodology includes the following criteria:
 - Self-labeling:** The issuer must consciously label the instrument as a green bond.
 - Public disclosure:** The issuer must provide sufficient information to determine if the financed assets are green. This includes information such as the amount outstanding and closing confirmation.
 - Eligible sectors:** The financed assets must be in eligible sectors, such as energy efficient products and processes, or non-energy GHG reductions.
 - Eligible use of proceeds:** The proceeds must be used for eligible purposes.
- Green Bonds Portfolio - CBI:** Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Data Treatments stated below apply but do not include item #2.
- Green Bonds Benchmark - CBI:** Market Value of Securities with Green Bond as a Percentage of the Total Market Value of all Securities in the Benchmark. Data Treatments stated below apply but do not include item #2.
- Green/Fossil Fuel Based Revenue Ratio - MSCI:** The Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio level and the Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio and Benchmark level. Data Treatments stated below apply, additional missing data treatment to replace nulls with zero.
- Companies with SBTi Approved Targets - MSCI:** The percentage of the fund's market value exposed to issuers that have carbon emissions reduction targets approved by the Science Based Targets initiative (SBTi) on both the Portfolio and Benchmark level. Data Treatments stated below apply but do not include item #2.
- Low Carbon Transition Score - MSCI:** Score calculates a company's climate transition risk by aggregating Scope 1, 2 and 3 emissions, emissions avoided, and the quality of the company's climate management into a score between 0 (highest risk) and 10 (lowest risk). Companies with higher Low Carbon

Transition score are more aligned with the Low Carbon Transition compared to the companies with lower scores. Score calculated at both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Risk Rating- ISS: Assesses a company's ability to deal with climate change and the transition to a low-carbon economy rated on a scale of 0 to 100, with 0 being very poor and 100 being excellent. The Carbon Risk Rating provides an aggregated score indicating a company's overall climate-related risk, using the company-specific risk exposure as baseline (Carbon Risk Classification) from which a company can take steps toward better alignment with a low carbon economy (Carbon Performance score).

Weighted Average of each Underlying Security with a Carbon Risk Rating Value for both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Footprint(t CO2e/\$M EVIC):

- Scope 1+2+3- MSCI:** Weighted average of Scope 1, Scope 2 and Scope 3 carbon emissions intensity normalized by enterprise value including cash. Data Treatments stated below apply.
- Scope 1+2:** - Data Treatments stated below apply.
- Scope 1:** - Data Treatments stated below apply.
- Scope 2:** - Data Treatments stated below apply.
- Scope 3:** - Data Treatments stated below apply.

Total Carbon Emissions - MSCI: Total Carbon Emissions measures the absolute tons of CO2e EVIC for which an investor is responsible. It is apportioned to the investor based on an equity ownership perspective, and can be explained with a simple example: If an investor's position in a company is equal to 1% of the company's total market capitalization, then the investor owns 1% of the company, and is consequently responsible for 1% of the company's carbon emissions (tons CO2e). Calculating the "owned" emissions from each position in the portfolio and summing those emissions yields the total carbon emissions for the portfolio and benchmark level.

- Scope 1:** emissions are "direct emissions" from sources that are owned or controlled by the company. Data Treatments stated below apply.
- Scope 2:** emissions are the indirect emissions released into the atmosphere from the use of purchased energy such as electricity, heat or steam. These are called "indirect emissions" because the actual emissions are generated at another facility such as a power station. Data Treatments stated below apply.
- Scope 3:** emissions are the indirect emissions released into the atmosphere from the use of purchased energy such as electricity, heat or steam. These are called "indirect emissions" because the actual emissions are generated at another facility such as a power station. Data Treatments stated below apply.

Scope 3 emissions include all other indirect emissions that occur across the value chain and are outside of the organization's direct control. Data Treatments stated below apply.

- Scope 1+2 - Data Treatments stated below apply.
- Total Carbon Emissions is not used to compare portfolios and benchmarks because the data is not normalized. Benchmark data will not appear in this section.
- Sovereign- Total Carbon Emissions – MSCI: Total carbon emissions includes all greenhouse gas emissions produced within a country's borders from all sources, including energy production, industry, agriculture, and transportation apportioned by PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollar).
- Scope 1 (excluding LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/ territory. Values exclude land use, land-use change and forestry (LULUCF).
- Scope 1 (including LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory' (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).
- Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.
- Weighted Avg Carbon Intensity - MSCI:
- Scope 1+2+3 - Calculating a portfolio's Weighted Average Carbon Intensity is achieved by calculating the carbon intensity (Scope 1 + 2 + 3 Emissions / \$M Sales) for each portfolio company and calculating the weighted average by portfolio weight. Data Treatments stated below apply.
- Scope 1 - Data Treatments stated below apply.
- Scope 2 - Data Treatments stated below apply.
- Scope 3 - Data Treatments stated below apply.
- Sovereign - Weighted Average Carbon Intensity - MSCI: Weighted Average Carbon Intensity (WACI) evaluates a portfolio's relative exposure to carbon intensive economies. Portfolio-weighted GHG emissions per sovereign GDP. (PPP GDP (PPP-adjusted GDP of the

country expressed in millions of US dollars.)

Scope 1 (exclude LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (include LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Implied Temperature Rise (°C) – MSCI: The climate scenario alignment uses MSCI's Implied Temperature Rise (ITR) model, which is a forward-looking temperature alignment metric for companies and portfolios. Specifically, the MSCI ITR methodology evaluates whether a company or portfolio are aligned with the Paris Agreement temperature goals – in particular, the maximal goal of limiting global mean surface temperature to an increase of no more than 1.5°C in the year 2100 compared with preindustrial levels. For example, an ITR of 2.5°C assigned to a given portfolio would indicate that the portfolio is exceeding its fair share of the global carbon budget, and that if everyone exceeded their fair shares by a similar proportion, by 2100 we would end up in a world with >2.5°C of warming compared to pre-industrial levels. Please note there is significant uncertainty related to this temperature estimate, and outputs differ amongst different data vendors as methodologies continue to evolve and mature.

- Portfolio:** Implied Temperature Rise aggregated at the Portfolio Level. Data Treatments stated below apply.
- Benchmark:** Implied Temperature Rise aggregated at the Benchmark Level. Data Treatments stated below apply.

Climate Value at Risk- MSCI: (Climate VaR): is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of climate change. It is similar to VaR, but focuses specifically on the risks and opportunities associated with climate change. Climate Value-at-Risk (Climate VaR) is designed to provide a forward-looking and return-based valuation assessment to measure climate related risks and opportunities in an investment portfolio.

- NGFS:**

strong> Network for Greening the Financial System. The NGFS scenarios were developed to provide a common starting point for analyzing climate risks to the economy and financial system. It is important to note that the NGFS scenarios are not forecasts: instead, they aim at exploring the bookends of plausible futures (neither the most probable nor desirable) for financial risk assessment.

- NDC:** Nationally determined contributions (NDC) embody efforts by each country to reduce national emissions and adapt to the impacts of climate change.
- REMIND:** (REgional Model of Investment and Development) REMIND is an energy-economy general equilibrium model linking a macro-economic growth model with a bottom-up engineering-based energy system model. It covers twelve world regions, differentiates various energy carriers and technologies and represents the dynamics of economic growth and international trade.
- Policy Risk VaR:** is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of policies related to climate change.
- Technology Opportunities VaR:** is a measure to estimate which companies may be the beneficiaries if 3°C, 2°C or 1.5°C aligned climate policies are implemented on a global level.
- Physical Risk VaR:** is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of physical climate risks that are either acute or chronic relating to climate change.

1.5°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS ORDERLY) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 1.5°C target and using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	1.5°C Technology Opportunity Company Climate VaR (REMIND NGFS ORDERLY) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 1.5°C target and calculated using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.
---	---

Aggregated Physical Risk Company Climate VaR (REMIND Orderly Average outcome) [%]	2°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS DISORDERLY) [%]
A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 1.5°C REMIND Orderly scenario. Data treatments stated below apply.	A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 2°C target and using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.
2°C Technology Opportunity Company Climate VaR (REMIND NGFS DISORDERLY) [%]	2°C Aggregated Physical Risk Company Climate VaR (REMIND Disorderly Average outcome) [%]
A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 2°C target and calculated using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.	A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 2°C REMIND Disorderly scenario. Data Treatments stated below apply.
3°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS NDC) [%]	3°C Aggregated Physical Risk Company Climate VaR (REMIND NGFS NDC) [%]
A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 3°C target and using carbon prices from the REMIND model under the NGFS NDC scenario.	A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 3°C REMIND Disorderly scenario. Data Treatments stated below apply.

A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 3°C target and calculated using carbon prices from the REMIND model under the NGFS NDC scenario. Data treatments stated below apply.	3°C Aggregated Physical Risk Company Climate VaR (REMIND NDC Average outcome) [%]
A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 3°C REMIND NDC scenario. Data treatments stated below apply.	

Product Involvement and Controversy Profile

Portfolio Product Involvement exposure measures involvement of portfolio holdings in controversial business activities. Product Involvement areas track companies' direct involvement in certain products or services, such as production, distribution, or related services. For most business activity categories, the level of Product Involvement is indicated using revenues as a proxy. The exception is for business activities where revenue data is not relevant, in which case the level of involvement is binary — involved or not involved.

Product involvement: Drivers may include revenue thresholds, activities, and ownership relationship. To address this complexity, State Street Investment Management has created an approach to evaluating commonly screened sustainability criteria for investors who seek screened portfolios. For more information about the data, metrics, and thresholds applied to each topic, refer to <https://www.ssga.com/library-content/assets/pdf/global/esg/2024/ssga-approach-to-esg-screening-methodology.pdf> State Street Investment Management Approach to Navigate Sustainable Investing Screening: Methodology.

- Arctic Oil & Gas Exploration - Sustainalytics:** Measures portfolio exposure to companies involved in oil and gas exploration in Arctic regions. Data Treatments stated below apply but do not include item #2, additionally Green Bonds are excluded (applicable for FI).
- Civilian Firearms - Sustainalytics and MSCI:** Measures portfolio exposure to companies involved in the manufacturing and/or retailing of small arms and associated ammunition/ components for civilian use. Data Treatments stated below apply but do not include item #2.
- Controversial Weapons - Sustainalytics and MSCI:** Measures portfolio exposure to companies associated with controversial

weapons. The following types of weapons are covered: cluster munitions, antipersonnel mines and land mines, biological and chemical weapons, nuclear weapons, depleted uranium, incendiary weapons and white phosphorus. Data Treatments stated below apply but do not include item #2.

- Extreme ESG Controversies – Sustainalytics:** Measures portfolio exposure to companies involved in incidents/ events that may pose business or reputational risk due to potential impacts on stakeholders, the environment, or the company's operations. Data Treatments stated below apply but do not include item #2.
- Oil Sands – Sustainalytics:** Measures portfolio exposure to companies that derive revenue from the extraction of oil sands. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.
- Thermal Coal – Sustainalytics:** Measures portfolio exposure to companies involved in the extraction or power generation of thermal coal. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.
- Tobacco – Sustainalytics and MSCI:** Measures portfolio exposure to companies that are involved in the production and manufacturing of tobacco and tobacco-related products (including vaping, pipes and other related products). Data Treatments stated below apply but do not include item #2.
- UN Global Compact Violators – Sustainalytics:** Measures portfolio exposure to companies who are in violation of UN Global Compact principles. The UN Global Compact (UNGC) is the world's largest corporate sustainability initiative. It sets forth 10 responsible business principles for companies to follow. Data Treatments stated below apply but don't include item #2.

Data Treatments:

State Street applies the data treatments where applicable to Sustainability Metrics. To review the data treatments and the metrics they are applied to please see the data treatments below.

- Exclusions: Exclude positions for specific security types that are not expected to have a score / rating. (Cash, Cash Equivalents*, Derivatives**, Rights and Warrants)
- Exclude securities without a value for a particular metric.
- Rebalance the position weights of covered securities.

ESG Score/ESG Rating – MSCI: Provide an opinion of sovereign and sub-sovereign entities' exposure to and management of ESG risks. MSCI ESG Research defines ESG risks to sovereign or sub sovereign entities as environmental, social, or governance-related issues that could impact the longterm sustainability of their economies. MSCI ESG Government Ratings are determined for countries, local authorities, and supranational administrative bodies and are relative to a global peer set. Each rating takes into consideration measures of environmental risk and management, knowledge and social capital, and the strength of financial,

judicial, and political systems. ESG Government Scores are calculated for all countries and then converted into a letter rating. The AAA rating represents the highest ESG Rating (i.e., lower ESG risk exposure and stronger risk management) whereas the CCC rating represents the lowest ESG Rating (i.e., higher ESG risk exposure and weaker risk management).

ESG Ratings Distribution - MSCI ESG Leaders:

- Rated AAA or AA:** Issuers(sovereign) that have strong management of financially relevant environmental, social and AA governance issues.
- ESG Average:** Rated A, BBB or BB: Issuers(sovereign) that have average management of ESG issues.
- ESG Laggards:** Rated B or CCC: Issuers(sovereign) that do not demonstrate adequate management of the financially relevant ESG risks that they face.
- ESG Not Covered:** Issuers(sovereign) which have not been evaluated for ESG sustainability risks.

Green Bonds – CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Bonds are identified as green if they meet the criteria for Climate Bonds Initiative's (CBI) green labelled database. For more information on the Green Bond Database methodology, please visit <https://www.climatebonds.net/data-insights/market-data/green-bond-dataset-methodology>

Adverse Sustainability Indicators(Weighted Average) - MSCI

- Average Income Inequality Score(Weighted):** measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution.
- Average Corruption Score(Weighted):** Perceptions of public-sector corruption, including bribery, diversion of public funds, use of public office for private gain, nepotism in the civil service, state capture and mechanisms available to prevent corruption.
- Average Rule of Law Score(Weighted):** measures the strength and predictability of a country's legal system and institutions. Assesses factors like: Protection of property rights, Contract enforcement, Absence of corruption, Public safety and security.
- Average Freedom of Expression Score(Weighted):** assesses the extent to which countries and their citizens enjoy freedom of expression. It evaluates the protection and promotion

of fundamental freedoms, including freedom of speech, press, assembly, and association.

- Average Political Stability Score(Weighted):** assesses the potential adverse impacts of investment decisions on sustainability factors. Analyzes various factors related to political stability, including government stability, internal conflict, and external conflict

Government Freedom Status MSCl:

- Free:** Countries with strong political rights and civil liberties.
- Partially Free:** Countries where some political rights and civil liberties are present, but there are challenges and limitations.
- Not Free:** Countries where political rights and civil liberties are largely absent.
- No Data:** No data available to evaluate a country's government based on political rights and civil liberties.

Treatments stated below apply.

- Brown Revenue Benchmark - MSCI:** Weighted Average of each Underlying Security with Brown Revenue for the Benchmark. Data Treatments stated below apply.

Potential Emissions - MSCI: Sum of Weighted Average Total Potential Emission of Fossil Fuel Reserves Normalized by EVIC \$MN (ktCO₂-eq per \$MN invested) on Portfolio and Benchmark Level. Data Treatments stated below apply.

Green Bonds: The Climate Bonds Initiative (CBI) defines green bonds as debt instruments that finance projects with environmental benefits, and the CBI Green Bond Database uses a methodology to evaluate and categorize projects as green. The CBI's methodology includes the following criteria:

 - Self-labeling:** The issuer must consciously label the instrument as a green bond.
 - Public disclosure:** The issuer must provide sufficient information to determine if the financed assets are green. This includes information such as the amount outstanding and closing confirmation.
 - Eligible sectors:** The financed assets must be in eligible sectors, such as energy efficient products and processes, or non-energy GHG reductions.
 - Eligible use of proceeds:** The proceeds must be used for eligible purposes.
- Green Bonds Portfolio - CBI:** Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Data Treatments stated below apply but do not include item #2.

- Green Bonds Benchmark - CBI:** Market Value of Securities with Green Bond as a Percentage of the Total Market Value of all Securities in the Benchmark. Data Treatments stated below apply but do not include item #2.
- Green/Fossil Fuel Based Revenue Ratio - MSCI:** The Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio level and the Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio and Benchmark level. Data Treatments stated below apply, additional missing data treatment to replace nulls with zero.

Companies with SBTi Approved Targets - MSCI: The percentage of the fund's market value exposed to issuers that have carbon emissions reduction targets approved by the Science Based Targets initiative (SBTi) on both the Portfolio and Benchmark level. Data Treatments stated below apply but do not include item #2.

Low Carbon Transition Score - MSCI: Score calculates a company's climate

transition risk by aggregating Scope 1, 2 and 3 emissions, emissions avoided, and the quality of the company's climate management into a score between 0 (highest risk) and 10 (lowest risk). Companies with higher Low Carbon Transition score are more aligned with the Low Carbon Transition compared to the companies with lower scores. Score calculated at both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Risk Rating- ISS: Assesses a company's ability to deal with climate change and the transition to a low-carbon economy rated on a scale of 0 to 100, with 0 being very poor and 100 being excellent. The Carbon Risk Rating provides an aggregated score indicating a company's overall climate-related risk, using the company-specific risk exposure as baseline (Carbon Risk Classification) from which a company can take steps toward better alignment with a low carbon economy (Carbon Performance score).

Weighted Average of each Underlying Security with a Carbon Risk Rating Value for both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Footprint(t CO2e/\$M EVIC):

- Scope 1+2+3- MSCI:** Weighted average of Scope 1, Scope 2 and Scope 3 carbon emissions intensity normalized by enterprise value including cash. Data Treatments stated below apply.
- Scope 1+2:** Data Treatments stated below apply.
- Scope 1:** Data Treatments stated below apply.
- Scope 2:** Data Treatments stated below apply.
- Scope 3:** Data Treatments stated below apply.

Total Carbon Emissions - MSCI: Total Carbon Emissions measures the absolute tons of CO2e EVIC for which an investor is responsible. It is apportioned to the investor based on an equity ownership perspective, and can be explained with a simple example: If an investor's position in a company is equal to 1% of the company's total market capitalization, then the investor owns 1% of the company, and is consequently responsible for 1% of the company's carbon emissions (tons CO2e). Calculating the "owned" emissions from each position in the portfolio and summing those emissions yields the total carbon emissions for the portfolio and benchmark level.

- Scope 1:** emissions are "direct emissions" from sources that are owned or controlled by the company. Data Treatments stated below apply.
- Scope 2:** emissions are the indirect emissions released into the atmosphere from the use of purchased energy such as electricity, heat or steam. These are

called "indirect emissions" because the actual emissions are generated at another facility such as a power station. Data Treatments stated below apply.

- Scope 3 emissions include all other indirect emissions that occur across the value chain and are outside of the organization's direct control. Data Treatments stated below apply.
- Scope 1+2 - Data Treatments stated below apply.

Total Carbon Emissions is not used to compare portfolios and benchmarks because the data is not normalized. Benchmark data will not appear in this section.

Sovereign- Total Carbon Emissions – MSCI: Total carbon emissions includes all greenhouse gas emissions produced within a country's borders from all sources, including energy production, industry, agriculture, and transportation apportioned by PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollar).

Scope 1 (excluding LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/ territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (including LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory' (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Weighted Avg Carbon Intensity - MSCI:

- Scope 1+2+3 - Calculating a portfolio's Weighted Average Carbon Intensity is achieved by calculating the carbon intensity (Scope 1 + 2 + 3 Emissions / \$M Sales) for each portfolio company and calculating the weighted average by portfolio weight. Data Treatments stated below apply.
- Scope 1 - Data Treatments stated below apply.
- Scope 2 - Data Treatments stated below apply.
- Scope 3 - Data Treatments stated below apply.

Sovereign - Weighted Average Carbon Intensity -

MSCI: Weighted Average Carbon Intensity (WACI) evaluates a portfolio's relative exposure to carbon intensive economies. Portfolio-weighted GHG emissions per sovereign GDP. (PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollars).)

Scope 1 (exclude LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (include LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Implied Temperature Rise (°C) – MSCI: The climate scenario alignment uses MSCI's Implied Temperature Rise (ITR) model, which is a forward-looking temperature alignment metric for companies and portfolios. Specifically, the MSCI ITR methodology evaluates whether a company or portfolio are aligned with the Paris Agreement temperature goals – in particular, the maximal goal of limiting global mean surface temperature to an increase of no more than 1.5°C in the year 2100 compared with preindustrial levels. For example, an ITR of 2.5°C assigned to a given portfolio would indicate that the portfolio is exceeding its fair share of the global carbon budget, and that if everyone exceeded their fair shares by a similar proportion, by 2100 we would end up in a world with >2.5°C of warming compared to pre-industrial levels. Please note there is significant uncertainty related to this temperature estimate, and outputs differ amongst different data vendors as methodologies continue to evolve and mature.

- Portfolio:** Implied Temperature Rise aggregated at the Portfolio Level. Data Treatments stated below apply.
- Benchmark:** Implied Temperature Rise aggregated at the Benchmark Level. Data Treatments stated below apply.

Climate Value at Risk- MSCI: (Climate VaR): is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of climate change. It is similar to VaR, but focuses specifically on the risks and opportunities associated with climate change. Climate Value-at-Risk (Climate VaR) is designed to provide a forward-looking and return-based

valuation assessment to measure climate related risks and opportunities in an investment portfolio.

- NGFS: Network for Greening the Financial System. The NGFS scenarios were developed to provide a common starting point for analyzing climate risks to the economy and financial system. It is important to note that the NGFS scenarios are not forecasts: instead, they aim at exploring the bookends of plausible futures (neither the most probable nor desirable) for financial risk assessment.
- NDC: Nationally determined contributions (NDC) embody efforts by each country to reduce national emissions and adapt to the impacts of climate change.
- REMIND: (Regional Model of Investment and Development) REMIND is an energy-economy general equilibrium model linking a macro-economic growth model with a bottom-up engineering-based energy system model. It covers twelve world regions, differentiates various energy carriers and technologies and represents the dynamics of economic growth and international trade.
- Policy Risk VaR: is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of policies related to climate change.
- Technology Opportunities VaR: is a measure to estimate which companies may be the beneficiaries if 3°C, 2°C or 1.5°C aligned climate policies are implemented on a global level.
- Physical Risk VaR: is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of physical climate risks that are either acute or chronic relating to climate change.

1.5°C Aggregated Policy Risk	Company Climate VaR (REMIND NGFS ORDERLY) [%]
A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 1.5°C target and using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 1.5°C target and using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.
1.5°C Technology Opportunity	Company Climate VaR (REMIND NGFS ORDERLY) [%]
A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 1.5°C target and calculated using carbon prices from the	A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 1.5°C target and calculated using carbon prices from the

REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	1.5°C Aggregated Physical Risk Company Climate VaR (REMIND Orderly Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 1.5°C REMIND Orderly scenario. Data treatments stated below apply.
2°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 2°C target and using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.	2°C Technology Opportunity Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 2°C target and calculated using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.
2°C Aggregated Physical Risk Company Climate VaR (REMIND Disorderly Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 2°C REMIND Disorderly scenario. Data Treatments stated below apply.	3°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS NDC) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 3°C target and using carbon prices from the REMIND model under the NGFS NDC scenario.

3°C Technology Opportunity Company Climate VaR (REMIND NGFS NDC) [%]	A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 3°C target and calculated using carbon prices from the REMIND model under the NGFS NDC scenario. Data treatments stated below apply.
3°C Aggregated Physical Risk Company Climate VaR (REMIND NDC Average outcome) [%]	A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 3°C REMIND NDC scenario. Data treatments stated below apply.

Product Involvement and Controversy Profile

Portfolio Product Involvement exposure measures involvement of portfolio holdings in controversial business activities. Product Involvement areas track companies' direct involvement in certain products or services, such as production, distribution, or related services. For most business activity categories, the level of Product Involvement is indicated using revenues as a proxy. The exception is for business activities where revenue data is not relevant, in which case the level of involvement is binary — involved or not involved.

Product involvement: Drivers may include revenue thresholds, activities, and ownership relationship. To address this complexity, State Street Investment Management has created an approach to evaluating commonly screened sustainability criteria for investors who seek screened portfolios. For more information about the data, metrics, and thresholds applied to each topic, refer to [State Street Investment Management Approach to Navigate Sustainable Investing Screening: Methodology](https://www.ssga.com/library-content/assets/pdf/global/esg/2024/ssga-approach-to-esg-screening-methodology.pdf).

- Arctic Oil & Gas Exploration - Sustainability:** Measures portfolio exposure to companies involved in oil and gas exploration in Arctic regions. Data Treatments stated below apply but do not include item #2, additionally Green Bonds are excluded (applicable for FI).
- Civilian Firearms - Sustainability and MSCI:** Measures portfolio exposure to companies involved in the manufacturing and/or retailing of small arms and associated ammunition/ components for civilian use. Data Treatments stated below apply but do not include item #2.

Controversial Weapons – Sustainalytics and MSCI: Measures portfolio exposure to companies associated with controversial weapons. The following types of weapons are covered: cluster munitions, antipersonnel mines and land mines, biological and chemical weapons, nuclear weapons, depleted uranium, incendiary weapons and white phosphorus. Data Treatments stated below apply but do not include item #2.

Extreme ESG Controversies – Sustainalytics: Measures portfolio exposure to companies involved in incidents/ events that may pose business or reputational risk due to potential impacts on stakeholders, the environment, or the company's operations. Data Treatments stated below apply but do not include item #2.

Oil Sands – Sustainalytics: Measures portfolio exposure to companies that derive revenue from the extraction of oil sands. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.

Thermal Coal – Sustainalytics: Measures portfolio exposure to companies involved in the extraction or power generation of thermal coal. Data Treatments stated below apply but do not include item #2 , additionally Green Bonds are excluded.

Tobacco – Sustainalytics and MSCI: Measures portfolio exposure to companies that are involved in the production and manufacturing of tobacco and tobacco-related products (including vaping, pipes and other related products). Data Treatments stated below apply but do not include item #2.

UN Global Compact Violators – Sustainalytics: Measures portfolio exposure to companies who are in violation of UN Global Compact principles. The UN Global Compact (UNGC) is the world's largest corporate sustainability initiative. It sets forth 10 responsible business principles for companies to follow. Data Treatments stated below apply but don't include item #2.

Data Treatments: State Street applies the data treatments where applicable to Sustainability Metrics. To review the data treatments and the metrics they are applied to please see the data treatments below.

- Exclusions: Exclude positions for specific security types that are not expected to have a score / rating. (Cash, Cash Equivalents*, Derivatives**, Rights and Warrants)
- Exclude securities without a value for a particular metric.
- Rebalance the position weights of covered securities.

ESG Score/ESG Rating – MSCI: Provide an opinion of sovereign and sub-sovereign entities' exposure to and management of ESG risks. MSCI ESG Research defines ESG risks to sovereign or sub sovereign entities as environmental, social, or governance-related issues that could impact the longterm sustainability of their economies. MSCI ESG Government Ratings are determined for countries, local authorities, and

supranational administrative bodies and are relative to a global peer set. Each rating takes into consideration measures of environmental risk and management, knowledge and social capital, and the strength of financial, judicial, and political systems. ESG Government Scores are calculated for all countries and then converted into a letter rating. The AAA rating represents the highest ESG Rating (i.e., lower ESG risk exposure and stronger risk management) whereas the CCC rating represents the lowest ESG Rating (i.e., higher ESG risk exposure and weaker risk management).

ESG Ratings Distribution - MSCI ESG Leaders:

- Rated AAA or AA:** Issuers(sovereign) that have strong management of financially relevant environmental, social and AA governance issues.
- ESG Average:** Rated A, BBB or BB: Issuers(sovereign) that have average management of ESG issues.
- ESG Laggards:** Rated B or CCC: Issuers(sovereign) that do not demonstrate adequate management of the financially relevant ESG risks that they face.
- ESG Not Covered:** Issuers(sovereign) which have not been evaluated for ESG sustainability risks.

Green Bonds – CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Bond's are identified as green if they meet the criteria for Climate Bonds Initiative's (CBI) green labelled database. For more information on the Green Bond Database methodology, please visit <https://www.climatebonds.net/data-insights/market-data/green-bond-dataset-methodology>

Adverse Sustainability Indicators(Weighted Average) - MSCI

- Average Income Inequality Score(Weighted):** measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution.
- Average Corruption Score(Weighted):** Perceptions of public-sector corruption, including bribery, diversion of public funds, use of public office for private gain, nepotism in the civil service, state capture and mechanisms available to prevent corruption.
- Average Rule of Law Score(Weighted):** measures the strength and predictability of a country's legal system and institutions. Assesses factors like: Protection of property rights, Contract enforcement, Absence of corruption, Public safety and security.

0px 20px\"><p class=\"text-sm\">Average Freedom of Expression Score(Weighted): assesses the extent to which countries and their citizens enjoy freedom of expression. It evaluates the protection and promotion of fundamental freedoms, including freedom of speech, press, assembly, and association.</p>\n <li style=\"padding: 0px 0px 0px 20px\"><p class=\"text-sm\">Average Political Stability Score(Weighted): assesses the potential adverse impacts of investment decisions on sustainability factors. Analyzes various factors related to political stability, including government stability, internal conflict, and external conflict</p>\n\n
\n <p class=\"text-sm\"><strong style=\"text-decoration:underline\">Government Freedom Status MSCl:</p>\n <ul style=\"list-style-type: none\">\n <li style=\"padding: 0px 0px 0px 20px\"><p class=\"text-sm\">Free: Countries with strong political rights and civil liberties.</p>\n <li style=\"padding: 0px 0px 0px 20px\"><p class=\"text-sm\">Partially Free: Countries where some political rights and civil liberties are present, but there are challenges and limitations.</p>\n <li style=\"padding: 0px 0px 0px 20px\"><p class=\"text-sm\">Not Free: Countries where political rights and civil liberties are largely absent.</p>\n <li style=\"padding: 0px 0px 0px 20px\"><p class=\"text-sm\">No Data: No data available to evaluate a country's government based on political rights and civil liberties.</p>\n \n

None of the Information in and of itself can be used to determine which securities to buy or sell or when to buy or sell them. The Information is provided "as is" and the user assumes the entire risk of any use it may make or permit to be made of the Information. No MSCI Party warrants or guarantees the originality, accuracy and/or completeness of the Information and each expressly disclaims all express or implied warranties. No MSCI Party shall have any liability for any errors or omissions in connection with any Information herein, or any liability for any direct, indirect, special, punitive, consequential or any other damages (including lost profits) even if notified of the possibility of such damages.

The returns on a portfolio of securities which exclude companies that do not meet the portfolio's specified Sustainable Investment criteria may trail the returns on a portfolio of securities which include such companies. A portfolio's Sustainable Investment criteria may result in the portfolio investing in industry sectors or securities which underperform the market as a whole.

"text": "-- Nexus-Sovereign Bond Support (gold doc) section 2.6
 Glossary + Disclosures.\nselect \n 'sustainability_source' as CODE,\n 'en-US' as CULTURE,\n -- Section 2.6 Glossary (escaped HTML, chunked for
 Oracle VARCHAR2 literal limit)\n '<div class=\"min-w-full prose prose-headings:text-lg prose-headings:mt-[25px] prose-p:text-navy-u11 mt-[25px] glossary-content\">\n <h2>Glossary</h2>\n <p><h4>Climate Metrics</h4></p>\n
\n <p class=\"text-sm\">Sustainability data is as of the date identified in the report sections above, usually on a month lag. All metrics are reported in USD unless otherwise stated.</p>\n
\n <p class=\"text-sm\">Portfolio Coverage is dependent upon the universe covered by State Street Investment Management's external providers. For certain markets and types of companies, there may be significant limitations in the availability of data, or in some cases, no data may be available at all. In such instances, the benchmark index provider, investment manager, an affiliate of the investment manager or another party may use data from a related entity as a proxy or generate estimated data to fill these gaps.</p>\n <p class=\"text-sm\">Data treatments stated below apply but do not include item #2.</p>\n
\n <p class=\"text-sm\"><strong style=\"text-decoration:underline\">Green Revenue - MSCI: Weighted Average of each Underlying Security with Green Revenue for the portfolio and benchmark level. Data Treatments stated below apply.</p>\n <p class=\"text-sm\"><strong style=\"text-decoration:underline\">Brown Revenue: Percentage of revenue from \"brown\" sectors and activities, including fossil fuel extractions, mining, operations, and power generation, employing MSCI revenue indicators. Brown revenue (%) is defined as the proportion of revenues a company derives from activities related to the extraction of fossil fuels, or power generation using fossil fuel-based energy sources. It reflects firms tied to conventional energy value chains.</p>\n <ul style=\"list-style-type: none\">\n <li style=\"padding: 0px 0px 0px 20px\"><p class=\"text-sm\">Brown Revenue Portfolio - MSCI: Weighted Average of each Underlying Security with Brown Revenue for the Portfolio. Data Treatments stated below apply.</p>\n <li style=\"padding: 0px 0px 0px 20px\"><p class=\"text-sm\">Brown Revenue Benchmark - MSCI: Weighted Average of each Underlying Security with Brown Revenue for the Benchmark. Data Treatments stated below apply.</p>\n \n <p class=\"text-sm\"><strong style=\"text-decoration:underline\">Potential Emissions - MSCI: Sum of Weighted Average Total Potential Emission of Fossil Fuel Reserves Normalized by EVIC \$MN (ktCO2-eq per \$MN invested) on Portfolio and Benchmark Level. Data Treatments stated below apply.</p>\n <p class=\"text-sm\"><strong style=\"text-decoration:underline\">Green Bonds: The Climate Bonds Initiative (CBI) defines green bonds as debt instruments that finance projects with environmental benefits, and the CBI Green Bond Database uses a methodology to evaluate and categorize projects as green. The CBI's methodology includes the following criteria:</p>\n <ul style=\"list-style-type: none\">\n <li style=\"padding: 0px 0px 0px 20px\"><p class=\"text-sm\">Self-labeling: The issuer must consciously label the instrument as a green bond.</p>\n

Public disclosure: The issuer must provide sufficient information to determine if the financed assets are green. This includes information such as the amount outstanding and closing confirmation.

Eligible sectors: The financed assets must be in eligible sectors, such as energy efficient products and processes, or non-energy GHG reductions.

Eligible use of proceeds: The proceeds must be used for eligible purposes.

Green Bonds Portfolio - CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Data Treatments stated below apply but do not include item #2.

Green Bonds Benchmark - CBI: Market Value of Securities with Green Bond as a Percentage of the Total Market Value of all Securities in the Benchmark. Data Treatments stated below apply but do not include item #2.

Green/Fossil Fuel Based Revenue Ratio - MSCI: The Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio level and the Sum of Green to Fossil Fuel Based Revenue Ratio on the Portfolio and Benchmark level. Data Treatments stated below apply, additional missing data treatment to replace nulls with zero.

Companies with SBTi Approved Targets - MSCI: The percentage of the fund's market value exposed to issuers that have carbon emissions reduction targets approved by the Science Based Targets initiative (SBTi) on both the Portfolio and Benchmark level. Data Treatments stated below apply but do not include item #2.

Low Carbon Transition Score - MSCI: Score calculates a company's climate transition risk by aggregating Scope 1, 2 and 3 emissions, emissions avoided, and the quality of the company's climate management into a score between 0 (highest risk) and 10 (lowest risk). Companies with higher Low Carbon Transition score are more aligned with the Low Carbon Transition compared to the companies with lower scores. Score calculated at both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Risk Rating- ISS: Assesses a company's ability to deal with climate change and the transition to a low-carbon economy rated on a scale of 0 to 100, with 0 being very poor and 100 being excellent. The Carbon Risk Rating provides an aggregated score indicating a company's overall climate-related risk, using the company-specific risk exposure as baseline (Carbon Risk Classification) from which a company can take steps toward better alignment with a low carbon economy (Carbon Performance score).

Weighted Average of each Underlying Security with a Carbon Risk Rating Value for both the Portfolio and Benchmark level. Data Treatments stated below apply.

Carbon Footprint(t CO2e/\$M EVIC):

- Scope 1+2+3- MSCI:** Weighted average of Scope 1, Scope 2 and Scope 3 carbon emissions intensity normalized by enterprise value including cash. Data Treatments stated below apply.
- Scope 1+2** - Data Treatments stated below apply.
- Scope 1** - Data Treatments stated below apply.
- Scope 2** - Data Treatments stated below apply.
- Scope 3** - Data Treatments stated below apply.

Total Carbon Emissions - MSCI: Total Carbon Emissions measures the absolute tons of CO2e EVIC for which an investor is responsible. It is apportioned to the investor based on an equity ownership perspective, and can be explained with a simple example: If an investor's position in a company is equal to 1% of the company's total market capitalization, then the investor owns 1% of the company, and is consequently responsible for 1% of the company's carbon emissions (tons CO2e). Calculating the "owned" emissions from each position in the portfolio and summing those emissions yields the total carbon emissions for the portfolio and benchmark level.

- Scope 1** emissions are "direct emissions" from sources that are owned or controlled by the company. Data Treatments stated below apply.
- Scope 2** emissions are the indirect emissions released into the atmosphere from the use of purchased energy such as electricity, heat or steam. These are called "indirect emissions" because the actual emissions are generated at another facility such as a power station. Data Treatments stated below apply.
- Scope 3** emissions include all other indirect emissions that occur across the value chain and are outside of the organization's direct control. Data Treatments stated below apply.
- Scope 1+2** - Data Treatments stated below apply.

Total Carbon Emissions is not used to compare portfolios and benchmarks because the data is not normalized. Benchmark data will not appear in this section.

Sovereign- Total Carbon Emissions – MSCI: Total carbon emissions includes all greenhouse gas emissions produced within a country's borders from all sources, including energy production, industry, agriculture, and transportation apportioned by PPP GDP (PPP adjusted GDP of the country expressed in millions of US dollar).

Scope 1 (excluding LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/ territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (including LULUCF) MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory' (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported emissions) – MSCI: The estimated consumption emissions for the country territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Weighted Avg Carbon Intensity - MSCI:

- Scope 1+2+3 - Calculating a portfolio's Weighted Average Carbon Intensity is achieved by calculating the carbon intensity (Scope 1 + 2 + 3 Emissions / \$M Sales) for each portfolio company and calculating the weighted average by portfolio weight. Data Treatments stated below apply.
- Scope 1 - Data Treatments stated below apply.
- Scope 2 - Data Treatments stated below apply.
- Scope 3 - Data Treatments stated below apply.

Sovereign - Weighted Average Carbon Intensity - MSCI: Weighted Average Carbon Intensity (WACI) evaluates a portfolio's relative exposure to carbon intensive economies. Portfolio-weighted GHG emissions per sovereign GDP. (PPP GDP (PPP-adjusted GDP of the country expressed in millions of US dollars.))

Scope 1 (exclude LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/ territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country/ territory. Values exclude land use, land-use change and forestry (LULUCF).

Scope 1 (include LULUCF) – MSCI: The most recently reported or estimated Scope 1 greenhouse gas emissions for the country/territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). Scope 1 emissions are domestic GHG emissions from sources located within the country territory. Values include land use, land-use change and forestry (LULUCF).

Consumption (Scope 1 exclude LULUCF + scope 2+3 - exported

emissions) – MSCI: The estimated consumption emissions for the country/ territory (if available), in tons of CO2 equivalent per year (tCO2e/yr). MSCI ESG Research calculates consumption emissions based on Scope 1 emissions excl. LULUCF plus Scope 2 and Scope 3 emissions minus exported emissions.

Implied Temperature Rise (°C) - MSCI: The climate scenario alignment uses MSCI's Implied Temperature Rise (ITR) model, which is a forward-looking temperature alignment metric for companies and portfolios. Specifically, the MSCI ITR methodology evaluates whether a company or portfolio are aligned with the Paris Agreement temperature goals – in particular, the maximal goal of limiting global mean surface temperature to an increase of no more than 1.5°C in the year 2100 compared with preindustrial levels. For example, an ITR of 2.5°C assigned to a given portfolio would indicate that the portfolio is exceeding its fair share of the global carbon budget, and that if everyone exceeded their fair shares by a similar proportion, by 2100 we would end up in a world with >2.5°C of warming compared to pre-industrial levels. Please note there is significant uncertainty related to this temperature estimate, and outputs differ amongst different data vendors as methodologies continue to evolve and mature.

- Portfolio:** Implied Temperature Rise aggregated at the Portfolio Level. Data Treatments stated below apply.
- Benchmark:** Implied Temperature Rise aggregated at the Benchmark Level. Data Treatments stated below apply.

Climate Value at Risk- MSCI: (Climate VaR): is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of climate change. It is similar to VaR, but focuses specifically on the risks and opportunities associated with climate change. Climate Value-at-Risk (Climate VaR) is designed to provide a forward-looking and return-based valuation assessment to measure climate related risks and opportunities in an investment portfolio.

- NGFS:** Network for Greening the Financial System. The NGFS scenarios were developed to provide a common starting point for analyzing climate risks to the economy and financial system. It is important to note that the NGFS scenarios are not forecasts: instead, they aim at exploring the bookends of plausible futures (neither the most probable nor desirable) for financial risk assessment.
- NDC:** Nationally determined contributions (NDC) embody efforts by each country to reduce national emissions and adapt to the impacts of climate change.
- REMIND:** (REgional Model of Investment and Development) REMIND is an energy-economy general equilibrium model linking a macro-economic growth model with a bottom-up engineering-based energy

system model. It covers twelve world regions, differentiates various energy carriers and technologies and represents the dynamics of economic growth and international trade.

Policy Risk VaR: is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of policies related to climate change.

Technology Opportunities VaR: is a measure to estimate which companies may be the beneficiaries if 3°C, 2°C or 1.5°C aligned climate policies are implemented on a global level.

Physical Risk VaR: is a measure to estimate the potential financial losses that a company or portfolio of assets could incur as a result of physical climate risks that are either acute or chronic relating to climate change.

1.5°C Aggregated Policy Risk	Company Climate VaR (REMIND NGFS ORDERLY) [%]
A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 1.5°C target and using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 1.5°C target and using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.
1.5°C Technology Opportunity	Company Climate VaR (REMIND NGFS ORDERLY) [%]
A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 1.5°C target and calculated using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.	A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 1.5°C target and calculated using carbon prices from the REMIND model under the NGFS Orderly scenario. Data treatments stated below apply.
1.5°C Aggregated Physical Risk	Company Climate VaR (REMIND Orderly Average outcome) [%]
A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 1.5°C REMIND Orderly scenario. Data treatments stated below apply.	A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 1.5°C REMIND Orderly scenario. Data treatments stated below apply.
2°C Aggregated Policy Risk	Company Climate VaR (REMIND NGFS DISORDERLY) [%]
A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 2°C target and using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.	A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 2°C target and using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.

downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 2°C target and using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.

2°C Technology Opportunity Company Climate VaR (REMIND NGFS DISORDERLY) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 2°C target and calculated using carbon prices from the REMIND model under the NGFS Disorderly scenario. Data treatments stated below apply.	2°C Aggregated Physical Risk Company Climate VaR (REMIND Disorderly Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow and wildfires continue along the 2°C REMIND Disorderly scenario. Data Treatments stated below apply.
3°C Aggregated Policy Risk Company Climate VaR (REMIND NGFS NDC) [%] A company's aggregated downside policy risk exposure according to all emission sources (Scope 1, 2, 3), expressed as a percentage of the company's market value, assuming a global 3°C target and using carbon prices from the REMIND model under the NGFS NDC scenario.	3°C Technology Opportunity Company Climate VaR (REMIND NGFS NDC) [%] A company's upside technology opportunity exposure, expressed as a percentage of the company's market value capped at 100%, assuming a global 3°C target and calculated using carbon prices from the REMIND model under the NGFS NDC scenario. Data treatments stated below apply.
3°C Aggregated Physical Risk Company Climate VaR (REMIND NDC Average outcome) [%] A company's expected downside or upside potential, expressed as a percentage of the company's market value, assuming trends in extreme cold, extreme heat, extreme precipitation, heavy snowfall, extreme wind, coastal flooding, fluvial flooding, tropical cyclones, river low flow	

and wildfires continue along the 3°C REMIND NDC scenario. Data treatments stated below apply.

Product Involvement and Controversy Profile

Portfolio Product Involvement exposure measures involvement of portfolio holdings in controversial business activities. Product Involvement areas track companies' direct involvement in certain products or services, such as production, distribution, or related services. For most business activity categories, the level of Product Involvement is indicated using revenues as a proxy. The exception is for business activities where revenue data is not relevant, in which case the level of involvement is binary — involved or not involved.

Product involvement: Drivers may include revenue thresholds, activities, and ownership relationship. To address this complexity, State Street Investment Management has created an approach to evaluating commonly screened sustainability criteria for investors who seek screened portfolios. For more information about the data, metrics, and thresholds applied to each topic, refer to [State Street Investment Management Approach to Navigate Sustainable Investing Screening: Methodology](https://www.ssga.com/library-content/assets/pdf/global/esg/2024/ssga-approach-to-esg-screening-methodology.pdf).

- Arctic Oil & Gas Exploration - Sustainalytics:** Measures portfolio exposure to companies involved in oil and gas exploration in Arctic regions. Data Treatments stated below apply but do not include item #2, additionally Green Bonds are excluded (applicable for FI).
- Civilian Firearms - Sustainalytics and MSCI:** Measures portfolio exposure to companies involved in the manufacturing and/or retailing of small arms and associated ammunition/ components for civilian use. Data Treatments stated below apply but do not include item #2.
- Controversial Weapons - Sustainalytics and MSCI:** Measures portfolio exposure to companies associated with controversial weapons. The following types of weapons are covered: cluster munitions, antipersonnel mines and land mines, biological and chemical weapons, nuclear weapons, depleted uranium, incendiary weapons and white phosphorus. Data Treatments stated below apply but do not include item #2.
- Extreme ESG Controversies - Sustainalytics:** Measures portfolio exposure to companies involved in incidents/ events that may pose business or reputational risk due to potential impacts on stakeholders, the environment, or the company's operations. Data Treatments stated below apply but do not include item #2.
- Oil Sands – Sustainalytics:** Measures portfolio exposure to companies that derive revenue from the extraction of oil sands. Data Treatments stated below apply but do not include item #2 , additionally

Green Bonds are excluded.

- Thermal Coal – Sustainalytics:** Measures portfolio exposure to companies involved in the extraction or power generation of thermal coal. Data Treatments stated below apply but do not include item #2, additionally Green Bonds are excluded.

Tobacco – Sustainalytics and MSCI: Measures portfolio exposure to companies that are involved in the production and manufacturing of tobacco and tobacco-related products (including vaping, pipes and other related products). Data Treatments stated below apply but do not include item #2.

UN Global Compact Violators – Sustainalytics: Measures portfolio exposure to companies who are in violation of UN Global Compact principles. The UN Global Compact (UNGC) is the world's largest corporate sustainability initiative. It sets forth 10 responsible business principles for companies to follow. Data Treatments stated below apply but don't include item #2.

Data Treatments: State Street applies the data treatments where applicable to Sustainability Metrics. To review the data treatments and the metrics they are applied to please see the data treatments below.

- Exclusions: Exclude positions for specific security types that are not expected to have a score / rating. (Cash, Cash Equivalents*, Derivatives**, Rights and Warrants)
- Exclude securities without a value for a particular metric.
- Rebalance the position weights of covered securities.

ESG Score/ESG Rating – MSCI: Provide an opinion of sovereign and sub-sovereign entities' exposure to and management of ESG risks. MSCI ESG Research defines ESG risks to sovereign or sub sovereign entities as environmental, social, or governance-related issues that could impact the longterm sustainability of their economies. MSCI ESG Government Ratings are determined for countries, local authorities, and supranational administrative bodies and are relative to a global peer set. Each rating takes into consideration measures of environmental risk and management, knowledge and social capital, and the strength of financial, judicial, and political systems. ESG Government Scores are calculated for all countries and then converted into a letter rating. The AAA rating represents the highest ESG Rating (i.e., lower ESG risk exposure and stronger risk management) whereas the CCC rating represents the lowest ESG Rating (i.e., higher ESG risk exposure and weaker risk management).

ESG Ratings Distribution – MSCI ESG Leaders:

- Rated AAA or AA:** Issuers (sovereign) that have strong management of financially relevant environmental, social and AA governance issues.

ESG Average: Rated A, BBB or BB: Issuers (sovereign) that have average management of ESG issues.

ESG Laggards: Rated B or CCC: Issuers(sovereign) that do not demonstrate adequate management of the financially relevant ESG risks that they face.

ESG Not Covered: Issuers(sovereign) which have not been evaluated for ESG sustainability risks.

Green Bonds – CBI: Market Value of Securities with Green Bonds as a Percentage of the Total Market Value of all Securities in the Portfolio. Bonds are identified as green if they meet the criteria for Climate Bonds Initiative's (CBI) green labelled database. For more information on the Green Bond Database methodology, please visit <https://www.climatebonds.net/data-insights/market-data/green-bond-dataset-methodology>

Adverse Sustainability Indicators(Weighted Average) - MSCI

- Average Income Inequality Score(Weighted): measures the extent to which the distribution of income (or, in some cases, consumption expenditure) among individuals or households within an economy deviates from a perfectly equal distribution.
- Average Corruption Score(Weighted): Perceptions of public-sector corruption, including bribery, diversion of public funds, use of public office for private gain, nepotism in the civil service, state capture and mechanisms available to prevent corruption.
- Average Rule of Law Score(Weighted): measures the strength and predictability of a country's legal system and institutions. Assesses factors like: Protection of property rights, Contract enforcement, Absence of corruption, Public safety and security.
- Average Freedom of Expression Score(Weighted): assesses the extent to which countries and their citizens enjoy freedom of expression. It evaluates the protection and promotion of fundamental freedoms, including freedom of speech, press, assembly, and association.
- Average Political Stability Score(Weighted): assesses the potential adverse impacts of investment decisions on sustainability factors. Analyzes various factors related to political stability, including government stability, internal conflict, and external conflict

Government Freedom Status MSCI:

- Free: Countries with strong political rights and civil liberties.
- Partially Free: Countries where some political rights and civil liberties are present, but there are challenges and

limitations.

- Not Free:** Countries where political rights and civil liberties are largely absent.

No Data: No data available to evaluate a country's government based on political rights and civil liberties.

Disclosures

State Street Global Advisors (SSGA) is now State Street Investment Management. Please click [here](https://www.ssga.com/) for more information.

The information presented above is intended to provide transparency to investors around sustainability characteristics of the fund. Presenting this information should not be construed as a representation of the fund's current or future investment objective, nor should it be viewed as an indicator of the fund manager's current or future investment decision-making.

For information regarding the fund's SFDR category, investors are encouraged to review the fund's <https://www.ssga.com/us/en/intermediary/fund-finder?tab=documents> [prospectus/KIID]. Investors should not evaluate an investment in the fund based solely on the information above, rather investors should consider other factors, including the fund's overall investment objective and risk profile. Investors are encouraged to review the fund's prospectus <https://www.ssga.com/us/en/intermediary/fund-finder?tab=documents> for more information regarding the fund.

Sustainability data is sourced from external providers. This data may be incomplete, inaccurate, or unavailable for certain companies, which could limit the ability to fully capture or reflect their sustainability characteristics. As a result, there may be limitations reported in the sustainability metrics or indicators.

The third-party information above has been obtained from sources believed to be reliable as of the date indicated, but its accuracy is not guaranteed. State Street Investment Management is not liable for investment decisions based on this information and it should not be relied on as such. There is no representation or warranty as to the current accuracy, reliability or completeness of this information.

Data and metrics have been sourced as follows from the following contributors as of the date of this report, and are subject to their disclosures below. All other data has been sourced by State Street Investment Management.

No MSCI Party shall have any liability for any errors or omissions in connection with any Information herein, or any liability for any direct, indirect, special, punitive, consequential or any other damages (including lost profits) even if notified of the possibility of such damages.

The returns on a portfolio of securities which exclude companies that do not meet the portfolio's specified Sustainable Investment criteria may trail the returns on a portfolio of securities which include such companies. A portfolio's Sustainable Investment criteria may result in the portfolio investing in industry sectors or securities which underperform the market as a whole.
